<i>Date:</i>	February 15, 2018
<i>Case No.:</i>	2017-000188ENV
<i>Project Title:</i>	Alcatraz Ferry Embarkation Project
<i>Zoning:</i>	Light Industrial District 40-X Height and Bulk District
<i>Block/Lot:</i>	9900/031, 031H, 033 (Pier 31½), and 200-150-07 (Fort Baker)
<i>Project Area:</i>	73,800 square feet (Pier 31½) and 39,200 square feet (Fort Baker)
<i>Project Sponsor</i>	National Park Service Brian Aviles – (415) 624-9685 Golden Gate National Parks Conservancy Catherine Barner – (415) 561-3000 Port of San Francisco Diane Oshima – (415) 274-0553
<i>Lead Agency:</i>	San Francisco Planning Department
<i>Staff Contact:</i>	Julie Moore – (415) 575-8733 julie.moore@sfgov.org

PROPOSED COMMISSION ACTION:

Consider whether to uphold staff's decision to prepare a Mitigated Negative Declaration (MND) under the California Environmental Quality Act (CEQA), or whether to overturn that decision and require the preparation of an Environmental Impact Report due to specified potential significant environmental effects of the proposed project.

PROJECT DESCRIPTION:

Alcatraz Island, a national historic landmark, is part of and managed by the Golden Gate National Recreation Area, a National Park Service unit that includes numerous park facilities within the San Francisco Bay area, including Fort Mason, Fort Baker, Ocean Beach, and Crissy Field. Under the proposed project, the Park Service seeks to enter into a long-term agreement with the Port of San Francisco for the development and operation of an improved ferry embarkation site at Pier 31½ to support Alcatraz Island visitors. The Port agreement would require the Park Service's selected concessioner to renovate the marginal wharf, the Pier 33 bulkhead buildings, and portions of the Pier 31 shed building. In addition, the Park Service's partner, the Golden Gate National Parks Conservancy, would renovate the Pier 31 bulkhead building and additional portions of the Pier 31 shed building. The project would provide a combination of indoor and outdoor spaces to welcome, orient, and provide improved basic amenities for the public. The proposed project would also include other administrative and operational spaces, such as new boarding ramps and floats to support the berthing of up to three ferry boats at a time for interpretive bay cruises and limited (2 ferries per day - weekend only) ferry service between Pier 31½ and the existing Fort Baker pier in the Golden Gate National Recreation Area, approximately two miles south of the City

of Sausalito. The proposed project would repair and upgrade the Fort Baker pier substructure, install a new gangway landing and float, and construct a new pedestrian pathway from the Bay Area Discovery Museum to the pier. Under the proposed project, the estimated number of ferry trips from the Pier 31 ½ site would increase by two ferry trips per day in the peak season.

ISSUES:

The Planning Department published a Preliminary Mitigated Negative Declaration (PMND) on December 6, 2017, and received an appeal letter from the City of Sausalito on December 27, 2017, appealing the determination to issue a MND. The appeal letter states that the PMND fails to adequately address the following issues:

1. Consultation Requirements: The Project is one of “Statewide, Regional, or Areawide Significance” and that the City failed to consult with Sausalito, as a “public agency which has transportation facilities within their jurisdiction that could be affected by the project.”
2. Traffic: Analysis of traffic and circulation impacts is deficient.
3. Mitigation Measures: PMND fails to impose required mitigation measures.
4. Project Description: Project description is vague and incomplete.
5. Project Setting: Environmental setting is incomplete and misleading.
6. Various Environmental Topics: Significant environmental impacts could occur if ferry passengers leave Fort Baker.
7. Land Use and Regulatory Consistency: Inadequate analysis of Coastal Zone Management Act and Marin Mammal Protection Act
8. Water Quality Impacts: Failure to mitigate pollutants and water quality impacts
9. Growth-Inducing Impacts: Inadequate analysis and no mitigation

No other comments (not appeals of the PMND) were received. All of the issues raised in the Appeal Letter have been addressed in the attached materials, which include:

1. A draft Motion upholding the decision to issue a MND;
2. Exhibit A to draft Motion, Planning Department Response to the Appeal Letter;
3. Exhibit B: Appeal Letter;
4. Exhibit C: Supplemental Transportation Study; and
5. PMND and Initial Study as amended, with deletions shown in ~~striketrough~~ and additions shown in underline. The amendments to the PMND do not change the overall conclusions.

RECOMMENDATION:

Staff recommends that the Planning Commission adopt the motion to uphold the PMND. No substantial evidence supporting a fair argument that a significant environmental effect may occur as a result of the project has been presented that would warrant preparation of an Environmental Impact Report.

ADOPTING FINDINGS RELATED TO THE APPEAL OF THE PRELIMINARY MITIGATED NEGATIVE DECLARATION, FILE NUMBER 2017-000188ENV FOR THE PROPOSED ALCATRAZ FERRY EMBARKATION PROJECT

MOVED, that the San Francisco Planning Commission (hereinafter "Commission") hereby AFFIRMS the decision to issue a Mitigated Negative Declaration, based on the following findings:

1. On November 16, 2016, pursuant to the provisions of the California Environmental Quality Act ("CEQA"), the State CEQA Guidelines, and Chapter 31 of the San Francisco Administrative Code, the Planning Department ("Department") received an Environmental Evaluation Application form for the Project, in order that it might conduct an initial evaluation to determine whether the Project might have a significant impact on the environment.
2. On December 6, 2017, the Department determined that the Project, as proposed, could not have a significant effect on the environment.
3. On December 6, 2017, a notice of determination that a Mitigated Negative Declaration would be issued for the Project was duly published in a newspaper of general circulation in the City, and the Mitigated Negative Declaration posted in the Department offices, and distributed all in accordance with law.

www.sfplanning.org

4. On December 27, 2017, an appeal of the decision to issue a Mitigated Negative Declaration was timely filed by Arthur J. Friedman of Sheppard, Mullin, Richter & Hampton LLP on behalf of the City of Sausalito.
5. A staff memorandum, dated February 15, 2018, addresses and responds to all points raised by appellant in the appeal letter. That memorandum is attached as Exhibit A and staff's findings as to those points are incorporated by reference herein as the Commission's own findings. Copies of that memorandum have been delivered to the City Planning Commission, and a copy of that memorandum is on file and available for public review at the San Francisco Planning Department, 1650 Mission Street, Suite 400.
6. On February 15, 2018, amendments were made to the Preliminary Mitigated Negative Declaration, adding text for information and clarification. Such amendments do not include new, undisclosed environmental impacts and do not change the conclusions reached in the Preliminary Mitigated Negative Declaration. The changes do not require "substantial revision" of the Preliminary Mitigated Negative Declaration, and therefore recirculation of the Preliminary Mitigated Negative Declaration would not be required.
7. On February 22, 2018, the Commission held a duly noticed and advertised public hearing on the appeal of the Preliminary Mitigated Negative Declaration, at which testimony on the merits of the appeal, both in favor of and in opposition to, was received.
8. All points raised in the appeal of the Preliminary Mitigated Negative Declaration at the February 22, 2018 City Planning Commission hearing have been responded to either in the Memorandum or orally at the public hearing.
9. After consideration of the points raised by appellant, both in writing and at the February 22, 2018 hearing, the San Francisco Planning Department reaffirms its conclusion that the proposed project could not have a significant effect upon the environment.
10. In reviewing the Preliminary Mitigated Negative Declaration issued for the Project, the Planning Commission has had available for its review and consideration all information pertaining to the Project in the Planning Department's case file.
11. The Planning Commission finds that Planning Department's determination on the Mitigated Negative Declaration reflects the Department's independent judgment and analysis.

The City Planning Commission HEREBY DOES FIND that the proposed Project, could not have a significant effect on the environment, as shown in the analysis of the Mitigated Negative Declaration, and HEREBY DOES AFFIRM the decision to issue a Mitigated Negative Declaration, as prepared by the San Francisco Planning Department.

Motion No. XXX
Hearing Date: February 22, 2018

Case No. 2017-000188ENV
Alcatraz Ferry Embarkation Project

I hereby certify that the foregoing Motion was ADOPTED by the City Planning Commission on February 22, 2018.

BACKGROUND

An environmental evaluation application (2017-000188ENV) for the proposed project (Project) was filed on behalf of the National Park Service ("Park Service"), the Golden Gate National Parks Conservancy, and the Port of San Francisco on November 16, 2016. The proposal was for the development and operation of an improved ferry embarkation site at Pier 31½ to support Alcatraz Island visitors. The Port agreement would require the Park Service's selected concessioner to renovate the marginal wharf, the Pier 33 bulkhead buildings, and portions of the Pier 31 shed building. In addition, the Park Service's partner, the Golden Gate National Parks Conservancy, would renovate the Pier 31 bulkhead building and additional portions of the Pier 31 shed building. The Project would provide a combination of indoor and outdoor spaces to welcome, orient, and provide improved basic amenities for the public. The proposed project would also include other administrative and operational spaces, such as new boarding ramps and floats to support the berthing of up to three ferry boats at a time to accommodate interpretive bay cruises and ferry service to Fort Baker (described below). The Project site at Pier 31½ is within the Light Industrial Use District, and is within a 40-X Height and Bulk District. The Project would require approval of a long-term lease agreement by the Port of San Francisco and the Board of Supervisors

As part of the Project, the Park Service would provide a maximum of two ferry trips per day on weekends only between Pier 31½ and the existing Fort Baker pier located within the Golden Gate National Recreation Area, under Park Service jurisdiction, approximately two miles south of the City of Sausalito. The Park Service proposes to repair and upgrade the Fort Baker pier substructure, install a new gangway landing and float, and construct an approximately 1,400-foot-long pedestrian pathway from the Bay Area Discovery Museum to the pier. Under the Project, the maximum number of ferry trips from the Pier 31½ embarkation site to Fort Baker would be two ferry trips per weekend day in the peak season. Ferry trips would be same day roundtrips only originating from Pier 31½ and would not accommodate bicycles.

In order to provide context for the Project and the appeal, a brief history of the Park Service's planning efforts for Fort Baker is provided here. The Fort Baker Plan, analyzed in the Fort Baker Plan Final Environmental Impact Statement (FEIS) issued in 1999-2000, established the Park Service's plan for preserving the former Army post and developing a conference and retreat center at Fort Baker. Following the Record of Decision, the Park Service and Sausalito came to an agreement to limit the size of the retreat center. The Cavallo Point Lodge at Golden Gate opened in 2008 and uses both historic and new buildings throughout Fort Baker. The plan also called for expanding and rehabilitating portions of the Bay Area Discovery Museum, creating potential

minor additions to the U.S. Coast Guard (USCG) station, converting the marina and historic boat shop to fully serve the public, removing bulkheads and roadways along the waterfront to improve its connectivity with the Cavallo Point Lodge, and improving the historic pier by installing fish-cleaning stations, new railings, and benches. The plan also noted the potential for the historic pier to provide water-based connections to other park sites in the future, but did not complete a project-level analysis for the ferry service as details were not developed at that time.

The National Park Service separately analyzed the Project in the Alcatraz Ferry Embarkation Environmental Impact Statement (EIS). As stated in the EIS, the Park Service desires an identifiable and well-functioning facility that provides a quality welcome and support program for visitors, orients visitors to the history of Alcatraz Island, and provides a connection to other Golden Gate National Recreation Area parklands and orientation to the national park system in general. The EIS evaluated several alternative locations for the embarkation facility: Pier 31½ and Pier 41 at the Port of San Francisco; and a site at Fort Mason. The EIS also evaluated opportunities for new or enhanced linkages to the bay and other park lands. The Draft EIS was available for public review from March 20 to June 4, 2015. After exhaustive study and review, the Park Service identified the Pier 31½ Alternative, inclusive of developing a limited ferry service to Fort Baker, as the preferred alternative among the alternatives evaluated in the EIS. The Park Service completed the FEIS in January 2017.¹ The Record of Decision was signed on January 11, 2018.² The Pier 31½ Alternative, as further refined, is the Project analyzed in the PMND.

A Preliminary Mitigated Negative Declaration (PMND) was published on December 6, 2017. On December 27, 2017, Arthur J. Friedman, of Sheppard, Mullin, Richter & Hampton LLP, on behalf of the City of Sausalito (Appellant or “Sausalito”) filed a letter appealing the PMND. The concerns listed below are summarized from the appeal letter, copies of which are included within this appeal packet. The concerns are listed in the order presented in the appeal letter. With one possible exception, the concerns address only the potential impacts caused by the Fort Baker ferry service in and around Sausalito and not in San Francisco.

APPELLANT ISSUES AND PLANNING DEPARTMENT RESPONSES

The concerns raised in the December 27, 2017 appeal letter are cited below and are followed by the Department’s responses.

CONCERN 1: Consultation Requirements. The Appellant states that the Project is one of “Statewide, Regional, or Areawide Significance” and that the City failed to consult with Sausalito, as a “public agency which has transportation facilities within their jurisdiction that could be affected by the project.”

¹ National Park Service, *Alcatraz Ferry Embarkation Final Environmental Impact Statement*, January 2017. Available at <https://parkplanning.nps.gov/document.cfm?parkID=303&projectID=41352&documentID=77056>.

² Ibid.

The Appellant's letter states:

The Project is one of "Statewide, Regional or Areawide Significance " under CEQA because it would "substantially affect sensitive wildlife habitats including but not limited to riparian lands, wet lands, bays, estuaries, marshes, and habitats for endangered, rare and threatened species..." (CEQA Guidelines, § 15026(b)(5)[sic]). (*See e.g.* , PMND pp. 139-140 [managed fish species]; pp. 142-142 [marine mammals]; pp. 144-145 [terrestrial mammals (bats)]; and pp. 145-146 [special status bird species]; *see also*: FEIS for Fort Baker Plan, p. 4- 23 ["Provision of ferry service to Fort Baker could increase turbidity and the amount of petroleum pollutants present in Horseshoe Bay resulting in potential adverse impact to water quality...Productivity of marine organisms could decrease as a result of petroleum leakage and increased turbidity, including potential reduction in eelgrass productivity....Increased wave action within Horseshoe Bay could also increase shoreline erosion and further reduce water quality."].)

Lead agencies responsible for projects of Statewide, Regional or Areawide Significance must consult with "transportation planning agencies" and "public agencies which have transportation facilities within their jurisdiction which could be affected by the project." (Pub. Res. Code § 21092.4(a); CEQA Guidelines, § 15086(a)(5).)

The City was required to consult with Sausalito because it is a public agency with transportation facilities within its jurisdiction which could be affected by the Project. CEQA defines such "transportation facilities" to include "major local arterials and public transit within five miles of the project site...." (Pub. Res. Code§ 21092.4(b); CEQA Guidelines,§ 15086(a)(5).) Several of Sausalito's major local arterials that *could* be affected by the Project are located well within a five-mile radius of the Fort Baker pier. Accordingly, the City was required to consult with Sausalito for this Project in the same manner as for "responsible agencies." (Pub. Res. Code§ 21092.4(a).) Specifically, the City was required to consult with Sausalito before determining which CEQA document to prepare so that Sausalito may assist the City in determining the appropriate environmental document for the Project, and to explain its reasons for recommending whether the City as lead agency should prepare an EIR or negative declaration for the Project. (CEQA Guidelines, § 15096(a) and (b).) The City, however, failed to consult with Sausalito in this manner, and thus failed to comply with CEQA's mandatory notice and public agency consultation requirements." (Pages 2 and 3 of Appeal Letter)

RESPONSE TO CONCERN 1: The Project is not of “Statewide, Regional or Areawide Significance,” but the City fulfilled any obligation to consult with Sausalito, and Sausalito failed to respond timely to the City’s Notice of Project Receiving Environmental Review with its concerns.

The Appeal asserts the Project is one of “Statewide, Regional or Areawide Significance” under CEQA section 15206(b)(5) (note corrected citation) because it would substantially affect sensitive wildlife habitats and habitats for endangered, rare and threatened species. The PMND determined that the project would have less-than-significant impacts on sensitive wildlife habitats and habitats for special-status species, including water quality impacts on San Francisco Bay. The only potentially significant biological resources impacts identified were related to special-status bats at Pier 31½ and to nesting birds at both sites, which would be less than significant with incorporation of mitigation measures.

Even if the Project were of Statewide, Regional or Areawide Significance, the Appellant is incorrect that the City would be required to consult with Sausalito under CEQA section 15086(a). This section, “Consultation Concerning Draft EIRs”, does not apply to Mitigated Negative Declarations. It states “the Lead Agency shall consult with and request comments on the draft EIR from...” The City has not prepared a draft EIR and, accordingly, has not solicited draft EIR comments from Sausalito. More appropriately, the City fulfilled the requirements of CEQA section 15072 “Notice of Intent to Adopt a Negative Declaration or Mitigated Negative Declaration.” In compliance with this section, the City issued a *Notice of Availability of and Intent to Adopt a Negative Declaration* on December 6, 2017, which was sent to Sausalito.

Even though not required to do so, the City nevertheless invited Sausalito to participate in the scoping of the environmental review for the Project. On September 13, 2017, the City issued a *Notification of Project Receiving Environmental Review* to public agencies, community organizations, owners of property within 300 feet of the project site (Fort Baker boundary), and occupants of the project sites. The purpose of the notice was to solicit comments on the potential environmental effects of the project. Sausalito received the notice, but did not provide any comments on the scope of environmental review or request consultation at that time.

In conclusion, the Project is not a project of Statewide, Regional or Areawide significance and, even if it were, the City complied with any CEQA requirements. The City’s requirement was to provide its “Notice of Intent to Adopt a Negative Declaration” to Sausalito, which the City fulfilled. Further, the City *did* invite Sausalito to provide comments on the potential environmental effects of the Project to be considered in the environmental review and Sausalito did not participate until its appeal on December 27, 2017.

CONCERN 2: Transportation: The appellant states that PMND's analysis of traffic and circulation impacts is deficient.

The Appellant's letter states:

"The Project's proposal to provide weekend ferry service between Pier 31 ½ and Fort Baker, located adjacent to Sausalito, will substantially increase pedestrian, bicycle and vehicular traffic along Alexander Avenue (a two-lane arterial road that connects Highway 101, Fort Baker, and Sausalito) as well as in the Marin Headlands and Sausalito. These additional visitors and traffic will exacerbate what are often severe, over-crowded conditions within Sausalito's historic downtown and waterfront, particularly during weekends and peak periods spanning from March through October. The PMND, however, neither analyzes nor mitigates these potentially significant impacts.

Instead, the PMND assumes that all ferry passengers arriving in Fort Baker will remain within Fort Baker as pedestrians and not generate *any* additional traffic or bicycle trips within or outside the park. The PMND therefore imposes no mitigation measures regulating the proposed Fort Baker ferry operations or its resulting impacts. However, these assumptions underlying nearly all of the PMND's less-than-significant impact findings regarding the proposed Fort Baker ferry service are a fallacy; unsupported and unsupportable by substantial evidence." (Page 1 of Appeal Letter)

"The PMND's Traffic and Circulation impacts analysis is limited to the immediate vicinity of the Fort Baker pier and the proposed new pedestrian walkways within the park...Based on the flawed assumption that no Fort Baker passengers will leave the confines of Fort Baker, the PMND concludes that the Project will not generate any additional traffic trips... The PMND's assumptions are unsupported and unsupportable by substantial evidence. To the contrary, substantial evidence supports a fair argument that Fort Baker ferry passengers will travel outside Fort Baker throughout the region. Notably, the NPS's FEIS for the Fort Baker Plan states in relevant part:

Increased visitation at Fort Baker would increase the demand for lodging, restaurant, and other tourist-oriented services in surrounding areas, especially in Sausalito, Tiburon and San Francisco. This business growth, combined with other park improvements, would potentially increase demand for local hotels. (Sedway Group 1980.)

(Fort Baker Plan FEIS, p. 5-4.) Thus, the NPS' prior FEIS alone constitutes substantial evidence supporting a fair argument that Fort Baker ferry passengers will travel beyond Fort Baker to Sausalito and other regional destinations.

The PMND's assumption that Fort Baker ferry passengers will remain within Fort Baker is largely premised on the statements that "no shuttle service" or bike rentals are currently available in the vicinity of the Fort Baker pier and serve arriving ferry passengers. (PMND, pp. 64, 79). However, the PMND imposes no mitigation measures to ensure that either existing condition at the Fort Baker pier remains unchanged through the life of the Project.

Moreover, contrary to the PMND's apparent conclusion, the unavailability of shuttle bus services for arriving passengers is *not* evidence mitigating the Project's potential impacts, but instead by itself constitutes substantial evidence supporting a fair argument that the Project may have significant environmental impacts. In the absence of available shuttle services, arriving Fort Baker ferry passengers will resort to individual vehicles for hire (*i.e.* Uber, Lyft, taxis) to transport them within and outside the park. The PMND's apparent assumption that the unavailability of shuttle services leaves arriving ferry passengers without vehicle transport simply ignores the realities of the modern, smart-phone carrying world.³ Fatally, the PMND does not consider, much less mitigate the virtually certain significant impacts resulting from numerous vehicles queueing and circling the vicinity of the Fort Baker pier to pick up or drop off ferry passengers. Nor does the PMND consider, much less mitigate the virtually certain significant impacts resulting from this same parade of vehicles meandering throughout Fort Baker and along Alexander Avenue, transporting ferry passenger/visitors to the Marin Headlands, Sausalito and other regional destinations." (Pages 7 and 8 of Appeal Letter)

RESPONSE TO CONCERN 2: Traffic congestion is not a significant impact under CEQA. Regardless, the Project would not add substantial new vehicle trips to local roadways or create transportation hazards.

With the Planning Commission's adoption of Resolution 19579 on March 3, 2016, the City no longer considers automobile delay, as described solely by level of service or similar measures of vehicular capacity or traffic congestion, to be a significant impact on the environment under

³ Equally puzzling is the PMND's suggestion that Fort Baker ferry passengers' purchase of a roundtrip ticket will constrain visitors to the confines of Fort Baker. Here again, the PMND does not consider, much less account for the likelihood of ferry passengers arriving at Fort Baker on a Saturday ferry, but then returning on a Sunday ferry to allow time for travel to Sausalito and other regional locations. It is equally plausible that Fort Baker ferry passengers will simply forego use of their return ticket and instead purchase a separate return ticket from the Sausalito ferry, or return to San Francisco by private car or other mode of transportation.

CEQA. Thus, even if traffic from the ferry service were to increase congestion in Sausalito, congestion in and by itself is not considered a significant impact. Consistent with Resolution 19579, the PMND provides an analysis of the Project's anticipated project-specific and cumulative contribution to vehicle miles traveled and induced automobile travel. In both instances, the analysis determined that the Project would not result in a significant project-specific or cumulative impact. Further, creation of a new transit service, such as the Fort Baker Ferry, may serve to reduce vehicle miles traveled by providing an alternative means of accessing Fort Baker from San Francisco.

The Appellant's primary concern – that ferry passengers will leave Fort Baker and travel to Sausalito, adding to congestion within Sausalito's downtown and waterfront areas – ignores the fact that ferry passengers have a choice of ferry services and select the destination they wish to visit. While many tourists do seek to visit downtown Sausalito, others may not. The Golden Gate Ferry and the Blue and Gold Fleet currently operate approximately twelve round trip ferries per day on the weekend from San Francisco to Sausalito. The Project would provide transportation for those visitors who seek alternate activities: to visit Fort Baker's many uses (the Bay Area Discovery Museum, the Cavallo Point Lodge, the Travis Marina, Battery Yates and the coastal bluffs, the fishing pier), to walk to the Golden Gate Bridge Scenic Vista Point, or to explore the nearby trails in the Marin Headlands. Currently, the only other means to visit Fort Baker is by car or bicycle. Visitors accessing Fort Baker by car or bicycle are more likely to continue to downtown Sausalito than pedestrian ferry passengers, as the distance between Fort Baker and Sausalito is approximately two miles. Therefore, the Project could reduce vehicle trips to Sausalito from Fort Baker visitors.

The Appellant's reference to the Fort Baker Plan FEIS as substantial evidence that Fort Baker ferry passengers will travel beyond Fort Baker to Sausalito and other regional destinations is without merit. To the extent that the Fort Baker Plan FEIS disclosed growth-inducing impacts is appropriate, as the Fort Baker Plan was a broad planning-level document that included the development of the Cavallo Point Lodge (restaurant, spa, hotel, and conference center), expanding and rehabilitating portions of the Bay Area Discovery Museum, creating minor additions to the U.S. Coast Guard station, converting the marina and historic boat shop to serve the public, and improving the historic pier to install fish cleaning stations, railings, and benches. The Fort Baker Plan FEIS assumes that visitors staying at the lodge would travel by vehicle and likely visit restaurants and other tourist-oriented services in surrounding areas, and that some visitors to the conference center would stay in lodging outside of Fort Baker. These uses are independent of visitors travelling on a same-day, round trip ferry visit from San Francisco.

The PMND transportation analysis assumes that the Project will not generate bicycle trips outside Fort Baker because the Park Service does not intend to accommodate bicycles on the ferries and because there are no bicycle rentals available at the Fort Baker pier. The Appellant states that the PMND should impose mitigation measures to ensure that there would be no bicycle rentals available for the life of the Project, and also argues that the PMND does not address or impose constraints on bicycle rentals elsewhere within Fort Baker or just outside the park. Firstly, it is

counter to CEQA to impose mitigation measures for speculative future conditions. Simply stated, there are no bicycles services proposed as part of the Project and none that are anticipated; the CEQA analysis is based on the Project as proposed. CEQA does not require mitigation measures to prevent project changes. Any potential future changes would be subject to individual project review. In addition, bicycle rentals outside the park would be under the jurisdiction of Sausalito which could impose constraints on this activity.

Because there is no public transit to Fort Baker and no bicycle or shuttle services are available or proposed by the Park Service, the most viable way for visitors to travel between Fort Baker and Sausalito would be by a for-hire vehicle such as Uber or Lyft or taxis, as suggested by the Appellant. While, for reasons stated above, it appears unlikely that Fort Baker ferry passengers would seek to travel to downtown Sausalito, there may be a remote possibility of some vehicle trips associated with the project. Therefore supplemental transportation analysis was conducted to address Sausalito's comments. The supplemental transportation study (included as **Exhibit C**) provides additional setting information describing transportation conditions in Sausalito, and examines transportation and circulation conditions under the very conservative assumption that as many as 50 percent of all Fort Baker ferry passengers could travel to downtown Sausalito by vehicle. Using an average vehicle occupancy (3.9 passengers per vehicle) obtained from transportation survey data and a peak day ferry occupancy of 250 passengers, a total of 32 new vehicle trips could be generated associated with each of the two ferry trips if half of the passengers travelled outside of Fort Baker.⁴ Thus, the number of net new car trips to Sausalito would likely be less than 30 vehicles per hour on a peak weekend. And, even if those trips happened to coincide with the peak hour of traffic volumes on Alexander Avenue, they would represent less than four percent of the existing peak weekend traffic on Alexander Avenue north of Bunker Road. Thus, the project is not expected to substantially increase traffic, pedestrians, or bicyclists in Sausalito and, therefore, is not expected to exacerbate existing traffic, bicycle, and pedestrian congestion levels in Sausalito or to create new hazards or exacerbate any existing hazards.

Per CEQA Guidelines Section 15063(b), an Environmental Impact Report (EIR) is prepared if there is substantial evidence that a project either individually or cumulatively may cause a significant adverse effect on the physical environment. The appellant does not provide substantial evidence that would indicate that the proposed project could have a significant impact on the environment, necessitating the preparation of an EIR. The PMND provides an accurate characterization of the proposed project as required by CEQA and provides substantial evidence that the proposed project could not result in significant impacts to the environment. Therefore, preparation of an EIR is not required.

⁴ Fehr & Peers, Alcatraz Embarkation Facility – Pier 31-1/2 Transportation Circulation Study, Response to PMND Appeal Transportation Concerns, February 3, 2018.

CONCERN 3: Mitigation Measures: The appellant states that the PMND fails to impose required mitigation measures.

Appellants claim that mitigation measures should have been developed for the Fort Baker project. The appellant's letter states:

The PMND "concludes that the Project will have no impacts, or less-than-significant impacts, based on the assumption that a certain set of conditions will remain in place throughout the life of the Project, or that the Project will comply with certain "applicable" Federal, state or local requirements or regulations. However, in each such instance, the PMND fails to ensure the existence of such conditions or compliance with applicable legal requirements through mandatory mitigation measures that are enforceable and specify clear performance standards. In fact, the PMND contains in total only 6 mitigation measures, none of which regulate the proposed Fort Baker ferry operations. {PMND, pp. 178- 182.} The PMND thus violates CEQA's substantive mandate that lead agencies "provide measures to mitigate or avoid significant effects on the environment that are fully enforceable through permit conditions, agreements or other measures." (Pub. Res. Code § 21081(b)) Because several of the PMND's less-than-significant impact findings are premised on the existence of conditions or future conduct that is not enforceable, all such findings are unsupported by substantial evidence.

The PMND's lack of enforceable mitigation measures is not cured by the NPS' Final Environmental Impact Statement (FEIS) for the Project, dated January 2017. As an initial matter, the City did not provide notice, and does not purport to rely on the FEIS in place of the PMND, as authorized under limited circumstances not applicable here. (CEQA Guidelines §15225(a).) In any event, the FEIS likewise imposes no mitigation measures regulating the potential land use, transportation and circulation, air quality, noise, water quality and hydrology, recreation, or hazardous material impacts resulting from the proposed Fort Baker ferry operations. (FEIS, pp. 78-86.)

Nor may the City avoid CEQA's substantive mandate to impose enforceable mitigation measures on the Project by claiming that NPS is responsible for mitigating impacts resulting from ferry service to Fort Baker." (Pages 3 and 4 of Appeal Letter)

RESPONSE TO CONCERN 3: The PMND analysis is based upon the project description as proposed, not upon speculation of what the project may be, and imposed appropriate mitigation measures, or relied on compliance with clear and enforceable regulations through required permit processes.

Mitigation measures were developed to address identified potential significant environmental impacts. CEQA does not require mitigation measures to be developed to address speculative future changes to the project.

The City analyzed the environmental impacts of the project as proposed by the project sponsors and identified mitigation measures for those effects which were found to be potentially significant. The Golden Gate National Parks Conservancy and the Park Service's selected concessioner/construction contractor would be required to comply with the PMND mitigation measures. Contrary to the comment, the PMND does not defer mitigation to the EIS; however, all mitigation measures in the FEIS would also apply. The Mitigation Monitoring and Reporting Program (MMRP) for the Project outlines who is responsible for implementation of mitigation measures, the monitoring and reporting requirements, and the monitoring agency. The Port of San Francisco and the Park Service, as appropriate, would ensure that mitigation measures are included in contract documents and monitor to ensure compliance.

Under CEQA Section 15126.4, mitigation measures are not required for effects which are not found to be significant. There must be an essential nexus (i.e., connection) between the mitigation measure and a legitimate governmental interest (i.e. protection of environmental resources). And the mitigation must be roughly proportional to the impact of the project. The Appellant has not provided substantial evidence to refute the PMND conclusions or presented substantial evidence of environmental impacts that would require additional mitigation measures. Instead, the Appellant contends that there should be mitigation measures regulating potential land use, transportation and circulation, air quality, noise, water quality and hydrology, recreation, and hazardous material impacts resulting from the proposed Fort Baker ferry operations. However the PMND analysis did not find any significant impacts related to these topics necessitating mitigation.

The Project is subject to a number of enforceable permits and regulations that are required as part of project approval. Mitigation measures are not required where compliance with necessary permits and enforceable regulations is mandatory. As described on PMND page 23, Project construction would require permits from the National Marine Fisheries Service, the U.S. Fish and Wildlife Service, U.S. Army Corps of Engineers, San Francisco Bay Conservation and Development Commission, Bay Area Air Quality Management District, and the San Francisco Bay Regional Water Quality Control Board. Park Service contractors/concessioners would be required to adhere to the standards of these permits and underlying regulations. Those regulations and permit processes provide a consistent framework and clear standards that, when applied, reduce potential biological resources, water, and air quality impacts. For example, as discussed on PMND page 158, construction activities within and over the Bay would be subject to the requirements of permits issued by the US Army Corps of Engineers under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act that would receive water quality certification from the RWQCB under Section 401 of the Clean Water Act. The permits would specify the best management practices for the protection of water quality. Implementation of water quality control measures proposed as part of the project and enforced through compliance with permit requirements would ensure that water quality impacts related to project activities within and over the Bay would be less than significant.

Contrary to the Appellant's claims, the components of plans to be developed during the permitting process are detailed in the PMND to describe how compliance would reduce impacts below significance. For example, the Park Service, as lead federal agency for the proposed project, initiated formal consultation under the Endangered Species Act with the National Marine Fisheries Service during the National Environmental Policy Act process. This consultation concluded on October 3, 2017, with issuance of the Biological Opinion for the proposed project.⁵ As part of the Endangered Species Act consultation, bioacoustic noise modeling was performed to assess the potential for the proposed project to cause adverse pile driving-related noise effects on managed fish species. The results of this evaluation are documented in the Biological Opinion. The Biological Opinion provides substantial evidence that the Project would have less-than-significant impacts on biological resources. As part of the consultation, the Park Service agreed to implement additional measures to ensure the effects of pile driving remain less than significant. These are included as Improvement Measures in the PMND, and would further reduce the less-than-significant impacts on biology.

Reliance on compliance with the applicable regulatory framework is common practice in CEQA. By both identifying the mechanism and analyzing the implementation, the PMND fully adheres to the requirements of CEQA.

The Appellant contends that the PMND is required to regulate and limit the Fort Baker ferry operations and prohibit an expansion of services. However, CEQA provides that the PMND need not engage in a speculative analysis of environmental consequences for future and unspecified development. If, subsequent to this PMND, the project sponsor proposes an expansion or revision to the Fort Baker ferry operations in the future, the project sponsor would be required to comply with any applicable provisions of CEQA and NEPA at that time.

All identified potential significant impacts have been identified, and any required mitigation measures have been provided in accordance with the requirements of CEQA.

CONCERN 4: Project Description: Appellant states that the PMND's project description is vague and incomplete.

The appellant's letter states:

CEQA "requires that initial studies/MNDs contain, among other things: (1) a description of the project including the location of the project; and (2) an identification of the environmental setting. (CEQA Guidelines, § 15063(d).) Notably, NPS' FEIS for the Fort Baker Plan adopted in 2000 stated that a separate planning process for ferry service to Fort Baker would provide "a detailed description of the physical facilities

⁵ National Marine Fisheries Service, Endangered Species Act Sections 7(a)(2) Biological Opinion and Magnuson-Stevens Fishery Conservation and Management Act Essential Fish Habitat Response for the Alcatraz Ferry Embarkation Project (NPS File No. L76[GOGA-PL]), October 3, 2017.

and operational characteristics (*i.e.*, frequency of trips, size of boats, land-side facilities, etc.) of ferry service at Fort Baker..." (Fort Baker Plan FEIS, p. 4- 23.) However, as explained below, the PMND provides none of the promised (and legally required) details regarding the proposed ferry service to Fort Baker.

The PMND states that the Project would provide two roundtrip ferry trips between Pier 31 ½ to Fort Baker on weekends only. It further estimates that the ferry would serve a daily average of 250 passengers, and 40,000 annual passengers. (PMND, pp. 17-18, Table 4.) No analysis or evidence, however, is provided to support these passenger estimates. Instead, they appear to be largely based on the Project's alleged limitation of two per day trips on weekends only. However, the PMND imposes no mitigation measure to ensure that no additional ferry trips will be added throughout the life of the Project. To the contrary, the PMND states that the number of ferry trips under the Project, including those to Fort Baker, "are not expected to grow...." (PMND, p. 17, referencing Tables 3 and 4, both of which include Fort Baker). Moreover, the FEIS for the Project confirms that additional ferry trips to Fort Baker will be provided for special events, conferences and water-based programs. (FEIS, pp. 66-67.) These additional ferry trips referenced in the FEIS are neither disclosed nor analyzed in the PMND.

Additionally, the PMND provides no information regarding the frequency of proposed ferry trips to Fort Baker, the type of ferry vessel(s) or the passenger capacity of ferry vessels that will provide this expanded service. This omitted information - which the Fort Baker Plan FEIS stated would be provided with this analysis - is highly material. For example, the Golden Gate Bridge Highway & Transportation District's (District) Spaulding class vessels serving the San Francisco-Sausalito route (and therefore a likely candidate to provide the expanded ferry service to Fort Baker) can accommodate 750 passengers *per trip* - well in excess of the PMND's estimate of 250 *daily* passengers from two roundtrip segments."

The PMND's estimates regarding total Fort Baker ferry passengers are further vague and incomplete in that they are fixed, based on some unspecified time and unspecified conditions, with no consideration or analysis of the potential for growth in visitors over the life of the Project. As an illustration, the FEIS for the Project explains that future capacity for ferry service to Alcatraz Island is based on "forecasted 20% growth in visitors to the site through 2036." (FEIS, p. 11.) The PMND, however, provides no comparable analysis regarding anticipated visitor growth to Fort Baker over time, nor any analysis of resulting impacts from such growth.

Moreover, the PMND states that no "shuttle service" or bike rentals are currently available to arriving passengers at the Fort Baker pier. (PMND, p. 20.) However, no information is provided regarding the availability or potential future availability of these resources for arriving ferry passengers beyond the immediate

vicinity of the Fort Baker pier, such as elsewhere within or just outside the park. Additionally, no information is provided regarding the availability or potential future availability of additional means of transportation at the Fort Baker pier, such as private cars, cars-for-hire (*i.e.*, Uber, Lyft, taxis), charters, vans and busses, that might transport arriving passengers elsewhere within the park, to nearby parks such as the Marin Headlands and Muir Woods, or to Sausalito.

The PMND's project description is further deficient because it fails to consider the Project "as a whole;" meaning, all phases of project planning, implementation, and operation, including phases planned for future implementation. (CEQA Guidelines, § 15063(a).) Under this CEQA requirement, a lead agency may not limit environmental disclosure by ignoring the development of other activity that will ultimately result from an initial approval."

The PMND states "that the Project's infrastructure improvements, including expanded ferry service to Fort Baker, are intended to facilitate expanded multi-modal visitor access to Fort Baker and beyond. The PMND states: "[t]he proposed project would improve cross-bay connectivity and accommodate existing and future visitor demand for recreational travel to Fort Baker *and the Marin Headlands*, thereby enhancing the Golden Gate National Recreation Area's operational effectiveness." (PMND, pp. 7-8 [emphasis added].) The PMND's "cumulative scenarios" analysis similarly acknowledges that recent plan actions implemented by the NPS include "improving multimodal connections between the Marin Headlands and Fort Baker by improving roadway surfaces and configurations... directional signage and safety." (PMND, p. 25.) The PMND's project description (and the PMND's analysis of potential environmental impacts) therefore should encompass the Project's broader, existing plans to expand multi-modal transportation of visitors to nearby parks and other regional destinations.

RESPONSE TO CONCERN 4: The proposed project description characterized in the Environmental Evaluation Application and analyzed in the PMND provide a sufficient level of detail about the proposed project upon which to evaluate the potential environmental impacts of the project for disclosure to decision-makers and the public.

As stated in the Appeal Letter, CEQA Guidelines section 15063(d) requires a description of the project, including the location of the project and an identification of the project setting. The project description needs to provide a sufficient level of detail about the proposed project upon which to evaluate the potential environmental impacts of the project for disclosure to decision-makers and the public. The PMND project description meets these requirements.

The Appeal Letter states that the project description does not describe "the physical facilities and operational characteristics (*i.e.*, frequency of trips, size of boats, land-side facilities, etc) of ferry

service at Fort Baker” and that “the PMND provides no information regarding the frequency of proposed ferry vessel(s) or the passenger capacity of ferry vessels that will provide this expanded service.” This is incorrect. Based on information provided by the Park Service, the PMND, page 14, describes the Fort Baker pier infrastructure repairs and improvements and the proposed pedestrian pathway that would be constructed to connect the Bay Area Discovery Museum and Cavallo Point Lodge with the pier. PMND pages 17-18 describe the frequency of ferry trips to Fort Baker, which would be limited to two ferry trips per day on weekends only. The ferry is expected to serve typically about 250 passengers per day on Saturdays and Sundays only, with a peak day of 500 passengers, resulting in an estimated 40,000 annual visitors (PMND Table 4, page 18). Ferry characteristics were also fully disclosed in the Air Quality and Greenhouse Gas Technical Report referenced in the PMND. The analysis assumed 208 annual ferry trips to Fort Baker. The maximum frequency of service was assumed to be two calls on a weekend day. Vessel size was assumed to be large enough to accommodate passengers, therefore, a 300-passenger vessel was used for the analysis. The FMND, as amended, includes information on vessel size for clarification.

Contradicting its assertion that the project description does not describe ferry operations, the Appeal Letter references the ferry frequency described in PMND pp. 17-18 and Table 4, yet states that “no analysis or evidence, however, is provided to support these passenger estimates.” A project description does not need to describe all of the planning tools and analyses used by the sponsor to develop its project, merely to provide sufficient information upon which to analyze the project’s potential environmental impacts. The number of ferry trips is consistent with the Alcatraz Ferry Embarkation FEIS (FEIS p. 31, Table 4), regardless of whether the FEIS considered that some of those trips could serve special events. The comment letter also erroneously notes that there is no information on the anticipated growth at Fort Baker due to the limited ferry service. The future capacity at the Pier 31½ site is based on the forecasted 20% growth in visitors to the Pier 31½ site through 2036 due to increases in overall San Francisco tourism. The Fort Baker service was considered within the lens of the larger analysis, and a portion of the new visitors at Pier 31½ would travel to Fort Baker. As defined in the PMND project description, the Fort Baker ferry service would be limited to a maximum of 40,000 passengers annually. No additional growth in Fort Baker ferry service is planned or anticipated.

The Appeal Letter’s speculation that the Golden Gate Bridge Highway & Transportation District’s Spaulding class vessels that can accommodate 750 passengers per trip would be a likely candidate for the limited ferry service to Fort Baker is misguided, as the Spaulding class vessels support a regular weekday and weekend service for commuters to and from different ferry terminals in San Francisco and in Sausalito. A variety of vessels of different passenger capacities (ranging from 125 to 350 passengers) currently serve Alcatraz and it is expected that the general fleet mix would stay the same. The ferry service is limited, as indicated in the project description.

The Project description states explicitly that “no shuttle service would be provided to serve ferry passengers” yet the Appeal Letter implies that the project description is deficient in that it does not describe “the availability or potential future availability of these resources...or of additional

means of transportation at the Fort Baker pier, such as private cars, charters, vans and busses that might transport arriving passengers elsewhere within the park, to nearby parks such as the Marin Headlands and Muir Woods, or to Sausalito.” Again, the Project does not propose shuttle service and, therefore, the project description is not deficient. The Park Service indicated that the Project is designed to provide an alternate means of transportation and promote visits to Fort Baker facilities such as the Bay Area Discovery Museum, the Cavallo Point Lodge, the Travis Marina, and nearby trails in the Golden Gate National Recreation Area, not the broader region. Refer to Concern 2 for additional discussion regarding the Appeal Letter’s speculations regarding transportation of ferry passengers outside of Fort Baker.

Finally, the Appeal Letter states the project description is deficient because it fails to consider the project “as a whole,” and “should encompass the Project’s broader, existing plans to expand multi-modal transportation of visitors to nearby parks and other regional destinations.” This is incorrect and misconstrues the Project objectives and the description submitted for analysis. The Appeal Letter states “the proposed project would improve cross-bay connectivity and accommodate existing and future demand for recreational travel to Fort Baker and the Marin Headlands, thereby enhancing the Golden Gate National Recreation Area’s operational effectiveness. (PMND, pp.7-8 [emphasis added].)” The emphasis appears to indicate that multi-modal transportation is necessary for visitors, but Appellants fail to recognize that the trails of the Marin Headlands are accessible to pedestrians from Fort Baker. “Connectivity” does not refer to direct transportation connections, but rather signage, maps, and information about the broader Golden Gate National Recreation Area parklands as a whole. As stated above, the Project would provide an alternate means of transportation to Fort Baker facilities such as the Bay Area Discovery Museum, the Cavallo Point Lodge, the Travis Marina, and nearby trails, not the broader region. The Project does not include or promote direct transportation connections between Fort Baker and Sausalito or the surrounding area. (See Response 2). The project description considers the whole of the Project.

Concern 5. Project Setting: The PMND’s Description of the Project’s environmental setting is incomplete and misleading.

The Appellant states that the PMND’s description of the environmental setting is deficient in at least two respects.

“First, the PMND refers to a variety of “operational and physical constraints, including limited parking at Fort Baker.” (PMND, p. 20, *see also* Figure 9.) However, no additional information is provided to describe the environmental setting in the vicinity of the Fort Baker pier, such as photographs, maps, plans or diagrams of this Project site. Absent this basic information regarding the Fort Baker pier environmental setting (*i.e.*, the location and capacity for parking, location and capacity for vehicle and/or bus pickups and drop offs, location and capacity for queuing, and location and capacity of access routes for circling the vicinity), the public may not meaningfully assess the Project’s potential traffic and circulation

impacts adjacent to the Fort Baker pier and along Moore Road resulting from vehicles queueing and/or circling to pick up or drop off ferry passengers.

Second, based on the PMND's erroneous assumption that all Fort Baker ferry passengers would not leave the confines of Fort Baker, the PMND provides a truncated description of the environmental setting potentially affected by the Fort Baker ferry service, limited to the vicinity immediately surrounding the Fort Baker pier. The PMND's description of the Project's environmental setting therefore is incomplete and inadequate because it must include, at a minimum, Alexander Avenue, the Marin Headlands and Sausalito - each of which will be affected by the proposed Fort Baker ferry service. The PMND's truncated and incomplete description of the Project's environmental setting potentially impacted by the Fort Baker ferry service precludes meaningful public consideration of the Project's potential environmental impacts. For example, the PMND fails to inform the public of the Project's heightened potential to cause significant impacts in Sausalito in light of existing, over-crowded conditions, as described in detail in Sausalito's Second Addendum to the Golden Gate Bridge Highway & Transportation District's 2012 Initial Study/Mitigated Negative Declaration for the Sausalito Ferry Terminal, dated October 4, 2017. (enclosed as **Exhibit A**).” (Pages 6 and 7 of Appeal Letter)

Response to Concern 5. The PMND fully describes the Project Setting as Required by CEQA.

As discussed above, the Project would provide an alternate means of transportation for visitors to the Fort Baker facilities and the accessible trail network of the Marin Headlands. Noting the “operational and physical constraints, including limited parking at Fort Baker” on PMND Page 20, the proposed ferry service operations are designed primarily for pedestrians, and seek to discourage bicycle and vehicle trips within Fort Baker and the general vicinity, including Sausalito, by selling only round-trip same day tickets from Pier 31½ to Fort Baker, and not providing parking or shuttle services. The Appeal Letter states that the PMND project setting in the vicinity of Fort Baker is incomplete because it does not provide “photographs, maps, plans or diagrams of the project site” and information regarding “the location and capacity of parking, location and capacity for parking, location and capacity for vehicle and/or bus pickups and drop off, the location and capacity for queuing, and location and capacity of access routes for circling the vicinity.” The PMND project description (page 15, Figures 9 and 10) provides a site plan and a perspective sketch of the project site. Additional details mentioned are more appropriately addressed within the PMND transportation and circulation section and its supporting technical analysis.⁶ The FMND, as amended, provides additional details, which do not change the conclusions of the PMND.

The Appeal Letter further states that the environmental setting should include Alexander Avenue, the Marin Headlands, and Sausalito in the event ferry passengers leave the confines of Fort Baker via vehicles, given the existing overcrowded roadway conditions in Sausalito. As discussed above

⁶ Fehr & Peers, *Alcatraz Embarkation Facility – Pier 31-1/2 Circulation Study*, December 4, 2017.

in Concern 2, the FMND, as amended, provides additional information regarding the roadways in the vicinity of Fort Baker in the transportation and circulation section, as appropriate, which do not change the conclusions of the PMND.

CONCERN 6: Various Environmental Topics: Appellant claims that significant environmental impacts could occur if ferry passengers leave Fort Baker.

Appellants contend that the PMND's analysis and findings regarding the Project's potential to cause environmental impacts is premised upon the flawed assumption that all Fort Baker ferry passengers would remain on foot within the park, and therefore generate no additional vehicle or bicycle trips. Appellants describe several specific environmental topics in the PMND that they contend are legally deficient; these are discussed individually in the subsections below.

GENERAL RESPONSE TO CONCERN 6: Even if Fort Baker ferry passengers leave Fort Baker, it would not change the conclusions about environmental impacts in the PMND.

Existing available ferry services to downtown Sausalito from San Francisco include the Golden Gate Ferry and the Blue and Gold Fleet. On weekend days, these companies provide twelve round-trip ferries to downtown Sausalito from the San Francisco's Ferry Building and Pier 41. With twelve ferries per weekend day departing from the Embarcadero, walking distance from the proposed Alcatraz Ferry embarkation site at Pier 31½, it is unlikely that individuals who wish to visit downtown Sausalito would opt to take a ferry to Fort Baker and then travel an additional two miles to downtown Sausalito. It is more likely that individuals who select to visit Fort Baker are more interested in visiting the Bay Area Discovery Museum, the Cavallo Point Lodge, the Travis Marina, the fishing pier, Battery Yates and its scenic lookout points, the Golden Gate Scenic Vista Point, or the trails of the Marin Headlands rather than the restaurants, art galleries, and souvenir shops in downtown Sausalito. However, because it cannot be known with certainty that none of the ferry passengers would leave Fort Baker and the Marin Headlands, additional analysis has been prepared to examine the potential environmental impacts suggested by the Appeal Letter.

Based on the transportation study analysis provided in the response to Concern 2, a total of 64 vehicle trips per weekend day could be generated if *half* of Fort Baker ferry passengers travelled outside of Fort Baker (a very conservative scenario). As there would be two ferry trips on a peak day, presumably the vehicle trips would be split between the two ferry visits, or 32 vehicle trips associated with each ferry visit. The FMND, as amended, reflects the possibility that ferry visitors may travel outside of Fort Baker and the Marin Headlands. As discussed below by environmental topic, this assumption would not change the findings and conclusions of the PMND.

CONCERN 6a: "Aesthetics." Because the PMND assumes that all Fort Baker arriving passengers will remain within Fort Baker as pedestrians, the PMND's aesthetic analysis is truncated, and limited in scope to potential scenic vista impacts in the immediate vicinity of the Fort Baker pier resulting from: "[operationally, intermittent ferry service

to the pier... " (PMND, pp. 39-40.) The PMND therefore provides no analysis of aesthetic impacts on scenic vistas from vehicles queuing and/or circling near Fort Baker pier to pick up and drop off ferry passengers. Nor does it analyze aesthetic impacts on scenic vistas from additional pedestrian, bicycle and vehicular traffic from Fort Baker ferry passengers traveling through Fort Baker, along Alexander Avenue, to and within nearby parks such as the Marin Headlands and Muir Woods, and to and within Sausalito's historic downtown and waterfront."

RESPONSE 6a: Project operations would not result in a substantial adverse effect on a scenic vista.

As defined in the PMND, a scenic vista is a location from which the public can experience unique and high-quality views, typically from elevated and uninterrupted vantage points that offer panoramic views of great breadth and depth. The PMND analysis was not limited to scenic vista impacts in the immediate vicinity of Fort Baker pier, as stated, but included the whole of Fort Baker and the Golden Gate Bridge Scenic Vista Point. Pedestrian, bicycle, and vehicular traffic are transitory in nature, and typically are not considered to be aesthetic impacts, but even if they were, traffic on Fort Baker roadways and Alexander Avenue would not block views from scenic vista points in the vicinity.

CONCERN 6b: "Noise. The PMND's analysis of potential noise impacts from Fort Baker ferry operations likewise is limited in scope to impacts on receptors in the immediate vicinity of the Fort Baker pier resulting from intermittent ferry service. (PMND, pp. 87-88.) The PMND thus provides no analysis of potential noise impacts from vehicles queuing and circling the Fort Baker pier vicinity to pick up and drop off ferry passengers. The PMND similarly fails to analyze potential noise impacts from Fort Baker ferry passengers traveling by various modes of transportation outside of Fort Baker, along Alexander Avenue to nearby parks, Sausalito and other regional destinations."

RESPONSE 6b: Potential noise impacts from vehicle trips would be imperceptible.

According to Caltrans traffic guidance, vehicle noise emissions increase with speed, and increased traffic volumes increase traffic noise, but it takes a doubling of traffic to increase noise levels by only 3 decibels,⁷ which is considered barely perceptible. As discussed on PMND page 81, a permanent increase of more than 5 decibels is considered a significant noise impact. Assuming the addition of 64 vehicles per day, or even 128 vehicles if *every* ferry passenger traveled to Sausalito, it would in no way double the traffic volumes within Fort Baker or along Alexander Avenue. Vehicular noise increases would not be perceptible and the Project would not result in significant noise impacts from vehicles dropping off or picking up passengers.

⁷ Caltrans, Division of Environmental Analysis, *Technical Noise Supplement*, p. 7-5, November 2009.

CONCERN 6c: “Air Quality.” The PMND's analysis of air quality impacts likewise is premised on the flawed assumption that no vehicle trips will be generated by Fort Baker operations. (PMND, p. 110.) The PMND thus provides no analysis of air quality impacts from increases in vehicular traffic from Fort Baker ferry passengers traveling within the Fort Baker and beyond along Alexander Avenue, to nearby parks, Sausalito and other regional destinations.”

RESPONSE 6c: Air quality impacts from potential vehicles serving ferry passengers at Fort Baker would not result in significant air quality impacts.

As discussed on PMND pages 106 to 109, the technical analysis presents operational emissions from Pier 31½ and Fort Baker. As shown, emissions of reactive organic gases (ROG), oxides of nitrogen (NO_x), and particulate matter (PM₁₀ and PM_{2.5}) are all well below the significance thresholds. The vehicle emissions reported for Pier 31½, which represented the emissions associated with 628 average daily vehicle trips, show that the inclusion of 64 vehicle trips per day would not alter the impact findings. Even a doubling of vehicle emissions would still result in less-than-significant impacts.

CONCERN 6d: “Greenhouse Gas Emissions.” The PMND's analysis of Greenhouse Gas Emissions likewise is premised on the flawed assumption that “[m]obile source emissions, which represent the bulk of operational greenhouse gas emissions, would, however, all originate from the Pier 31 ½ site; there would be no new ferry trips or vehicle trips originating from Fort Baker as a result of the proposed project.” (PMND, p. 117.) The PMND thus provides no analysis of greenhouse gas impacts from idling ferries docked at the Fort Baker pier while passengers load and unload, queuing and circling vehicles picking up or dropping off ferry passengers, or the additional vehicular traffic from Fort Baker ferry passengers traveling to nearby parks, Sausalito and other regional destinations.”

RESPONSE 6d: Greenhouse gas emissions from the Project are well below CEQA thresholds.

As discussed on PMND pages 114 to 118, greenhouse gas emissions for Project operations at both 31½ and Fort Baker would result in up to 232 metric tons per year of carbon dioxide equivalent (CO₂E), well below the Bay Area Air Quality Management District’s significance threshold of 1,100 metric tons per year. Inclusion of additional vehicle trips at Fort Baker would not result in any new impacts.

CONCERN 6e: “Recreation.” The PMND's analysis of Recreation impacts likewise is premised on the flawed assumption that “[v]isitors arriving by ferry from the primary embarkation site are not expected to leave Fort Baker so they would not cause an increase in the use of existing parks and recreational facilities in the area.” (PMND, p. 120.) The PMND thus provides no analysis of potential recreation impacts from Fort

Baker ferry passengers traveling to nearby parks, including the Marin Headlands, Muir Woods, and multiple parks located along Sausalito's historic waterfront - adding to existing, over-crowded conditions.”

RESPONSE 6e: The Project would not increase the use of existing parks and recreation facilities such that substantial deterioration would result.

The Project would increase visitors to Fort Baker and the Marin Headlands. As discussed on PMND page 120, the periodic increase in visitors can be accommodated by existing facilities at Fort Baker and nearby trails of the Marin Headlands. Given the amount of open space, the variety of activities, and exemplary views from within Fort Baker and the Marin Headlands, it is unlikely that ferry passengers would travel to visit the multiple parks on Sausalito's historic waterfront more than two miles away. Even if half or all Fort Baker ferry passengers travelled to downtown Sausalito, there are multiple parks along the waterfront to absorb these visitors without having substantial adverse effects. The potential for additional visitors to deteriorate these facilities is remote; therefore, impacts on recreational facilities would be less than significant.

CONCERN 6f: “Public Services. Here too, because the PMND assumes that Fort Baker ferry passengers will not leave Fort Baker, it provides no analysis of the Project's potential impacts on police and fire public services as well as emergency response times resulting from increased pedestrian, bicycle and vehicular traffic along Alexander Avenue, within the nearby parks and Sausalito. (PMND, pp. 127-128.)”

RESPONSE 6f: The concern is not based upon the criteria for a public services impact.

The analysis of public services impacts at Fort Baker is based upon the potential increase of 40,000 visitors annually, which would not result in a substantial increased demand on police and fire public services to such an extent that new governmental facilities would need to be constructed. There is no information to suggest that the impacts of the Project on police and fire services would be any more severe if some ferry passengers travelled outside of Fort Baker. As discussed in the response to Concern 2 regarding transportation and circulation, increased vehicular traffic along Alexander Avenue would be negligible and would not be expected to affect emergency response times.

CONCERN 7: Land Use and Regulatory Consistency: Appellant states the PMND fails to adequately analyze potential land use and regulatory consistency impacts regarding the Coastal Zone Management Act and Marine Mammal Protection Act.

The appellant's letter states:

“Lead agencies under CEQA must analyze a project's potential to cause significant land use and planning impacts. A project may cause significant land use impacts where, among other things, it conflicts with any applicable land use plan, policy or regulation of an agency with jurisdiction over the project accepted for the

purpose of avoiding or mitigating an environmental effect; or conflicts with any applicable habitat conservation plan or natural communities conservation plan. (CEQA Guidelines, Appendix G.)

The PMND concludes that the Project is compliant with all "relevant" regulations under the Clean Water Act, Endangered Species Act, Bay Plan and McAtteer-Peetris Act. (PMND, p. 36.) This analysis, however, is incomplete because it fails to consider whether the proposed Fort Baker ferry service complies with applicable legal requirements under the Coastal Zone Management Act (CZMA) (16 U.S.C. § 1451 *et seq.*) and the Marine Mammal Protection Act (MMPA). (16 U.S.C. §§ 1372, 1374.)...The PMND provides no analysis nor evidence of the Project's compliance with the CZMA's requirements...

The PMND acknowledges that construction activity at the Fort Baker pier could annoy marine mammals and cause them to change course to avoid the construction area. The PMND, however, contains no mitigation measures to reduce impacts to marine mammals to less than significant. It provides instead only an "Improvement Measure," which states in relevant part:

If marine mammals enter the safety zone after pile driving of a segment has begun, *pile driving will continue*. The biologist will monitor and record the species and number of individuals observed, and make note of their behavior patterns. If the animal appears distressed, *and if it is operationally safe to do so*, pile driving will cease until the animal leaves the area.

(PMND, p. 184. [emphasis added]) Thus, although the PMND acknowledges that Project construction activity will proceed in many cases, notwithstanding clearly visible annoyance and disruption of marine mammal behavior patterns, the PMND provides no analysis nor explanation regarding why such Project activity would not constitute a "take" under the MMPA." (Pages 10 and 11 of Appeal Letter)

RESPONSE TO CONCERN 7: The PMND is adequate because it considers and incorporates the proposed Fort Baker ferry service compliance with applicable legal requirements under the Coastal Zone Management Act (CZMA) (16 U.S.C. § 1451 *et seq.*) and the Marine Mammal Protection Act (MMPA). (16 U.S.C. §§ 1372, 1374.).

In addition to its permit authority under state law, the San Francisco Bay Conservation and Development Commission (BCDC) exercises authority under Section 307 of the CZMA. On September 15, 2017, the Park Service submitted a conceptual proposal for the Project to BCDC, requesting that BCDC concur that the proposed project is consistent with its Amended Coastal Zone Management Program for San Francisco Bay. BCDC determined that the project, in concept,

is consistent with the Commission's Amended Management Program for San Francisco Bay.⁸ The PMND page 32 describes the BCDC consistency determination for the proposed project. Regardless, inconsistencies with plans and policies do not, in and of themselves, indicate a significant physical environmental effect under CEQA. As demonstrated in the PMND, the project would not result in significant physical environmental impacts.

The Appellant states that the PMND contains no mitigation measures to reduce impacts to marine mammals to less than significant and provides instead only an "Improvement Measure". On page 142 of the PMND it was determined, "similar to fish species, due to the extremely short pile driving duration, location of pile driving, low number of piles, and use of bubble curtains, the proposed project would result in less-than-significant impacts to marine mammals." Because there were no significant impacts to marine mammals, mitigation measures are not required. However, as described in the Biological Opinion⁹ prepared by NOAA's National Marine Fisheries Service (NMFS) and in the PMND, to further ensure that underwater noise effects remain consistent with the levels anticipated through bioacoustics noise modeling, the project proponent would implement improvement Measure I-BI-1c, Marine Mammal Safety Zone. Also in the Biological Opinion, NMFS determined that "the amount or extent of anticipated take, coupled with other effects of the proposed action, is not likely to result in jeopardy to the Southern DPS of American green sturgeon or destruction or adverse modification of critical habitat."

The analysis in the PMND indicates that the proposed project would not cause a significant impact to biological resources. The appellant does not provide substantial evidence that would indicate that the proposed project would have a significant impact on biological resources requiring additional mitigation measures.

CONCERN 8: Water Quality Impacts: Appellant states the PMND fails to adequately analyze and mitigate pollutants and water quality impacts.

The appellant's letter states:

"The FEIS for the Fort Baker Plan previously noted that the provision of ferry service to Fort Baker could increase turbidity and the amount of petroleum pollutants present in Horseshoe Bay resulting in potential adverse impact to water quality. (Fort Baker Plan FEIS, p. 4-23.). The PMND, however, concludes that the Fort Baker ferry service will have less than significant impacts either because the Project will comply with all "applicable" Federal, state and local requirements and regulations; or

⁸ San Francisco Bay Conservation and Development Commission, Consistency Determination No. C2017.005.00, October 25, 2017.

⁹ National Marine Fisheries Service, Endangered Species Act Section 7(a)(2) Biological Opinion and Magnuson-Stevens Fishery Conservation and Management Act Essential Habitat Response for the Alcatraz Ferry Embarkation Project (NPS File No. L76 [GOGA-PL], October 3, 2017.

alternatively, plans will be "developed" to identify and mitigate potential impacts. Both approaches, however, violate CEQA.

The PMND repeatedly finds that the Fort Baker ferry service will have no impacts or less than significant impacts because the Project will comply with "applicable" Federal, state and local requirements and regulations. For example, while the PMND acknowledges that "[f]erry operations have the potential to impact water quality from potential pollutant discharges of hazardous materials, including chemicals and solvents used onboard, boat cleaning and maintenance materials, fuels, bilge or ballast water, sewage from toilets, and gray water, and trash from passengers and visitors," it concludes that such impacts would be less than significant because operations at Fort Baker "would adhere with plans and policies designed to address potential water quality impacts." (PMND, pp. 157-158.) The PMND further states that Project impacts would be less than significant because:

- Vessel fueling would adhere to Coast Guard regulations;
- Any spills would be "cleaned up immediately using spill response equipment as identified in the Spill Prevention Control and Countermeasure Plan;
- Discharges and quantities of ballast water would occur in compliance with "federal and state regulations, including the Vessel General Permit and Ballast Water Management for Control of Nonindigenous Species Act; and
- Sanitary sewage ferries would be subject to the requirements of the MARPOL convention and Section 312 of the Clean Water Act; and
- Due to the proximity of Pier 31 ½ and Fort Baker to the Bay, litter from visitors at the site could potentially enter the bay. The ferry operator would be responsible for implementation of a trash collection and management program, and waste management at both proposed project sites would proceed in accordance with all applicable federal, state and local regulations for waste management disposal." (PMND, pp158-159.)

The foregoing less-than-significant impact findings, however, are unsupported by substantial evidence and violate CEQA because they are premised on conditions and assumptions regarding the Project's future compliance with legal requirements that are not imposed on the Project as legally enforceable mitigation measures. (See PMND, p. 155 [no mitigation measures identified for Hydrology and Water Quality Impacts].) The PMND thus violates CEQA's substantive mandate to impose feasible and enforceable mitigation measures to *ensure* that a project's environmental impacts remain less than significant throughout the life of the project.

Adding to the foregoing legal deficiencies, the PMND's analysis of hazards and water quality impacts also relies on deferred "development" of plans to identify future mitigation measures. For example, the PMND states:

The Park Service would prepare a Stormwater Pollution Prevention Plan for operations at Fort Baker. The Stormwater Pollution Plan Prevention Plan would identify pollutant sources within the site and provide site-specific best management practices regarding control of sediments in runoff and storage and use of hazardous materials to prevent discharge of pollutants into stormwater.

(PMND, p. 158.) The PMND thus concludes that: "[w]hile the proposed project would result in a minor increase in the number of ferry trips... and would introduce limited ferry service to Fort Baker, *development of required plans* and compliance with regulations as detailed above would ensure that water quality impacts associated with long-term operations of the proposed project would be less than significant." (PMND, p. 159.)

Here, the PMND's reliance on *future* "plans" to be "developed" to mitigate the Project's potential impacts contravenes CEQA's prohibition of "deferred" mitigation. Under CEQA, "formulation of mitigation measures should not be deferred until some future time" as this frustrates review by the public." (Pages 11 and 12 of the Appeal Letter)."

RESPONSE TO CONCERN 8: Compliance with specific regulatory requirements is not "deferred mitigation."

This concern reiterates elements of Concern 3, above. The Project is subject to a number of enforceable permits and regulations that are required as part of project approval. Mitigation measures are not required where compliance with necessary permits and enforceable regulations is mandatory and will include specific measures designed to mitigate impacts adequately. As described on PMND page 156, Project construction would require permits from the San Francisco Bay Conservation and Development Commission, U.S. Army Corps of Engineers, and the San Francisco Bay Regional Water Quality Control Board. Park Service contractors/concessionaires would be required to adhere to the standards of these permits and underlying regulations. Contrary to the Appellant's comment, the components of any plans that are required by law are described in the PMND hazardous material and water quality sections detailing how compliance would reduce impacts below significance. For example, as discussed in the Water Quality and Hydrology Section, the project would need a National Pollutant Discharge Elimination System (NPDES) permit, and as a requirement of the permit, the Park Service would be required to prepare and implement a Stormwater Pollution Prevention Plan (SWPPP) for operations at the Fort Baker site. The text then fully details what elements the SWPPP would include and how the implementation of the SWPPP would reduce the potential for significant impacts on water quality.

By both identifying the mechanism and analyzing the implementation, the PMND fully adheres to the requirements of CEQA. In situations where impacts for which mitigation is known to be feasible, the agency can commit itself to devising measures that satisfy specific performance criteria articulated at the time of project approval. Where future action to carry a project forward is contingent on devising means to satisfy such criteria, the agency should be able to rely on that regulatory process as evidence that significant impacts will in fact be mitigated.

CONCERN 9: Growth-Inducing Impacts: Appellant states the PMND fails to adequately analyze and mitigate growth-inducing quality impacts.

The appellant's letter states:

"CEQA requires that lead agencies describe any growth-inducing impacts of the proposed project. (Pub. Res. Code § 21100(b)(5); CEQA Guidelines, § 15126(d).) Lead agencies must discuss the ways in which the project could directly or indirectly foster economic or population growth or the construction of new housing in the surrounding environment. (CEQA Guidelines, § 15126.2(d).) The discussion should also include characteristics of the project that may encourage and facilitate other activities that could have a significant effect on the environment, either individually or cumulatively. The CEQA Guidelines explain that projects, like the Fort Baker ferry service aspect of the Project, that make improvements to infrastructure, are more likely to be growth-inducing. (CEQA Guidelines, § 15126.2(d).)

As noted above, the NPS' FEIS for the Fort Baker Plan concluded that the increase of visitors to Fort Baker would cause growth-inducing impacts in the surrounding area, including Sausalito. (Fort Baker Plan FEIS, p. 5-4.) This evidence alone constitutes substantial evidence supporting a fair argument that the Fort Baker ferry service may cause significant growth-inducing impacts. Yet despite the NPS's previous acknowledgment of potential significant impacts, the PMND provides no analysis whatsoever of the Fort Baker ferry service's potential to cause growth-inducing impacts in Sausalito or elsewhere within the region. (PMND, p. 44.)" (Pages 12 and 13 of Appeal Letter)

RESPONSE TO CONCERN 9: The Project would not induce substantial population growth, either directly or indirectly.

As discussed in PMND pages 43-44, a project would be considered growth-inducing if its implementation would result in substantial population growth that is unplanned and results in significant physical impacts on the environment. The Project would not induce population growth directly (by proposing new homes), nor would Fort Baker ferry infrastructure improvements induce population growth to the Sausalito area, as ferry service would not support commuters. The PMND acknowledges that the Project may result in a modest workforce increase of

approximately 20 employees for concessions at Pier 31½, which would not induce substantial growth as these jobs could be readily filled by the Bay Area workforce.

To the extent that the Fort Baker Plan EIS disclosed growth-inducing impacts is appropriate, as the Fort Baker Plan was a broad planning-level document that included the development of the Cavallo Point Lodge, expanding and rehabilitating portions of the Bay Area Discovery Museum, creating minor additions to the U.S. Coast Guard station, converting the marina and historic boat shop to serve the public, and improving the historic pier to install fish cleaning stations, railings, and benches. The plan also noted the potential for the historic pier to provide water-based connections to other park sites in the future. Potential growth-inducing impacts of the comprehensive Fort Baker Plan under NEPA does not constitute substantial evidence that this Project, which includes only limited infrastructure at Fort Baker, would result in significant growth-inducing impacts under CEQA.

CONCLUSION

Staff recommends that the Planning Commission adopt the motion to uphold the Preliminary Mitigated Negative Declaration, as amended. No substantial evidence supporting a fair argument that a significant environmental effect may occur as a result of the project has been presented that would warrant preparation of an Environmental Impact Report. By upholding the PMND, the Planning Commission would not prejudice or restrict its ability to consider whether the proposed project's uses or design are appropriate for the neighborhood.

Re: Appeal of Preliminary Mitigated Negative Declaration Regarding Alcatraz Ferry
Embarkation Project (Case No. 2017-000188ENV)

Dear Ms. Gibson

This firm represents the City of Sausalito (Sausalito) regarding the above-referenced matter. Pursuant to the Notice of Availability of and Intent to Adopt a Negative Declaration, dated December 6, 2017, and San Francisco Administrative Code section 13.11, subsection (e), Sausalito appeals the San Francisco Planning Department's (City) proposed Preliminary Mitigated Declaration (PMND) for the Alcatraz Ferry Embarkation Project (Project).

SUMMARY OF CONCERNS AND OBJECTIONS

The Project's proposal to provide weekend ferry service between Pier 31 ½ and Fort Baker, located adjacent to Sausalito, will substantially increase pedestrian, bicycle and vehicular traffic along Alexander Avenue (a two-lane arterial road that connects Highway 101, Fort Baker, and Sausalito) as well as in the Marin Headlands and Sausalito. These additional visitors and traffic will exacerbate what are often severe, over-crowded conditions within Sausalito's historic downtown and waterfront, particularly during weekends and peak periods spanning from March through October. The PMND, however, neither analyzes nor mitigates these potentially significant impacts.

Instead, the PMND assumes that all ferry passengers arriving in Fort Baker will remain within Fort Baker as pedestrians and not generate *any* additional traffic or bicycle trips within or outside the park. The PMND therefore imposes no mitigation measures regulating the proposed Fort Baker ferry operations or its resulting impacts. However, these assumptions underlying nearly all of the PMND's less-than-significant impact findings regarding the proposed Fort Baker ferry service are a fallacy; unsupported and unsupportable by substantial evidence. Because, as explained below, substantial evidence supports a fair argument that Fort Baker ferry passengers may cause a myriad of significant environmental impacts, the City may not lawfully approve the PMND under California's Environmental Quality Act (CEQA), and instead must prepare an Environmental Impact Report (EIR) to fully assess the potential direct and indirect impacts of the proposed Fort Baker ferry service. Alternatively, the City and the National Park Service (NPS) may sever the proposed Fort Baker ferry service from the Project.

RELEVANT LEGAL STANDARDS

CEQA was enacted as a means to require public agency decision makers to document and consider the environmental implications of their actions. (Pub. Res. Code § 21000, 21001; *Friends of Mammoth v. Board of Supervisors* (1972) 8 Cal. 3d 247, 254-256.) CEQA contains a substantive mandate that public agencies refrain from approving projects with significant environmental effects if “there are feasible alternatives or mitigation measures” that can substantially lessen or avoid those effects. (Pub. Res. Code § 21002.) CEQA should be interpreted so “as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language.” (*Friends of Mammoth, supra*, at 259.)

Members of the public hold a “privileged position” in the CEQA process. (*Concerned Citizens of Costa Mesa, Inc. v. 32nd District Agricultural Association* (1986) 42 Cal. 3d 926, 936.) CEQA procedures must be scrupulously followed so that the “public will know the basis on which its responsible officials either approve or reject environmentally significant action,” and will be able to “respond accordingly to action with which it disagrees.” (*Laurel Heights Improvement Association v. Regents of the University of California* (1988) 47 Cal. 3d 376, 392.)

“CEQA requires the preparation of an EIR whenever it can *fairly be argued* on the basis of substantial evidence that the project *may* have a significant environmental impact.” (Pub. Res. Code §§ 21002.1, 21061; *No Oil, Inc. v. City of Los Angeles* (1974) 13 Cal. 3d 68, 75.) The CEQA Guidelines define “substantial evidence” in relevant part as:

Enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached.... Substantial evidence shall include facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts.

(CEQA Guidelines, § 15384 (a) and (b).) A “significant effect on the environment” is defined as a substantial, or potentially substantial, adverse change in any of the physical, conditions within the area affected by the project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic and aesthetic significance.” (CEQA Guidelines, § 15382.)

THE CITY FAILED TO COMPLY WITH SPECIAL CONSULTATION REQUIREMENTS THAT APPLY TO THIS PROJECT OF STATEWIDE, REGIONAL, OR AREAWIDE SIGNIFICANCE

The Project is one of “Statewide, Regional or Areawide Significance” under CEQA because it would “substantially affect sensitive wildlife habitats including but not limited to riparian lands, wet lands, bays, estuaries, marshes, and habitats for endangered, rare and threatened species...” (CEQA Guidelines, § 15026(b)(5)). (See *e.g.*, PMND pp. 139-140 [managed fish species]; pp. 142-142 [marine mammals]; pp. 144-145 [terrestrial mammals (bats)]; and pp. 145-146 [special status bird species]; see also: FEIS for Fort Baker Plan, p. 4-23 [“Provision of ferry service to Fort Baker could increase turbidity and the amount of petroleum pollutants present in Horseshoe Bay resulting in potential adverse impact to water quality...Productivity of marine organisms could decrease as a result of petroleum leakage and increased turbidity, including potential reduction in eelgrass productivity....Increased wave

action within Horseshoe Bay could also increase shoreline erosion and further reduce water quality.”].)

Lead agencies responsible for projects of Statewide, Regional or Areawide Significance must consult with “transportation planning agencies” and “public agencies which have transportation facilities within their jurisdiction which could be affected by the project.” (Pub. Res. Code § 21092.4(a); CEQA Guidelines, § 15086(a)(5).)

The City was required to consult with Sausalito because it is a public agency with transportation facilities within its jurisdiction which could be affected by the Project. CEQA defines such “transportation facilities” to include “major local arterials and public transit within five miles of the project site....” (Pub. Res. Code § 21092.4(b); CEQA Guidelines, § 15086(a)(5).)¹ Several of Sausalito’s major local arterials that *could* be affected by the Project are located well within a five-mile radius of the Fort Baker pier. Accordingly, the City was required to consult with Sausalito for this Project in the same manner as for “responsible agencies.” (Pub. Res. Code § 21092.4(a).) Specifically, the City was required to consult with Sausalito before determining which CEQA document to prepare so that Sausalito may assist the City in determining the appropriate environmental document for the Project, and to explain its reasons for recommending whether the City as lead agency should prepare an EIR or negative declaration for the Project. (CEQA Guidelines, § 15096(a) and (b).) The City, however, failed to consult with Sausalito in this manner, and thus failed to comply with CEQA’s mandatory notice and public agency consultation requirements. The City therefore may not lawfully approve the PMND for this reason alone.

THE CITY MAY NOT LAWFULLY APPROVE THE PMND UNDER CEQA

A. The PMND Fails To Impose Required Mitigation Measures on the Project

Repeatedly, throughout the document, the PMND concludes that the Project will have no impacts, or less-than-significant impacts, based on the assumption that a certain set of conditions will remain in place throughout the life of the Project, or that the Project will comply with certain “applicable” Federal, state or local requirements or regulations. However, in each such instance, the PMND fails to ensure the existence of such conditions or compliance with applicable legal requirements through mandatory mitigation measures that are enforceable and specify clear performance standards. In fact, the PMND contains in total only 6 mitigation measures, none of which regulate the proposed Fort Baker ferry operations. (PMND, pp. 178-182.) The PMND thus violates CEQA’s substantive mandate that lead agencies “provide measures to mitigate or avoid significant effects on the environment that are fully enforceable

¹ “The statute makes clear that a lead agency’s obligations to consult pursuant to Section 21092.4 are not contingent on a finding of significant impacts on particular transportation facilities; rather, a lead agency must consult with those entities whose facilities *could* be affected by the project.” (Remy et al., *Guide to CEQA* (11th ed.) (Solano Press 2007), p. 937, n. 12 (citing *Gentry v. City of Murrieta* (1995) 36 Cal. App. 4th 1359, 1387-1388) [interpreting the required level of “effect” under similar CEQA requirement triggering consultation as quite minimal to in order to serve the statutory purpose of fostering interagency consultation.])

SheppardMullin

Lisa M. Gibson
December 27, 2017
Page 4

through permit conditions, agreements or other measures.” (Pub. Res. Code § 21081.6(b).) “Mitigation measures must be feasible and enforceable.” (*Federation of Hillside Canyon Assn. v. City of Los Angeles* (2004) 126 Cal. App. 4th 1180, 1198.)² Additionally, as discussed below, because several of the PMND’s less-than-significant impact findings are premised on the existence of conditions or future conduct that is not enforceable, all such findings are unsupported by substantial evidence.

The PMND’s lack of enforceable mitigation measures is not cured by the NPS’ Final Environmental Impact Statement (FEIS) for the Project, dated January 2017. As an initial matter, the City did not provide notice, and does not purport to rely on the FEIS in place of the PMND, as authorized under limited circumstances not applicable here. (CEQA Guidelines §15225(a).)³ In any event, the FEIS likewise imposes no mitigation measures regulating the potential land use, transportation and circulation, air quality, noise, water quality and hydrology, recreation, or hazardous material impacts resulting from the proposed Fort Baker ferry operations. (FEIS, pp. 78-86.)

Nor may the City avoid CEQA’s substantive mandate to impose enforceable mitigation measures on the Project by claiming that NPS is responsible for mitigating impacts resulting from ferry service to Fort Baker. The Court in *Citizens for Quality Growth v. City of Mt. Shasta* (1988) 198 Cal. App. 3d 433, rejected a similar effort by a city to defer mitigation of a project’s impacts on wetlands to the Army Corps of Engineers’ permit procedures, stating: “[E]ach public agency is required to comply with CEQA and meet its responsibilities, including evaluating mitigation measures and project alternatives.” (*Id.*, p. 442, fn. 8, citing CEQA Guidelines, § 15020) (emphasis in original).

B. The PMND’s Project Description Is Vague and Incomplete

An accurate project description is the *sine qua non* of an informative, legally adequate CEQA document. (*County of Inyo v. City of Los Angeles* (1977) 71 Cal. App. 3d 185, 192.) Without an accurate description on which to base the CEQA analysis, CEQA’s objective of furthering public disclosure and informed environmental decision-making is stymied. CEQA thus requires that initial studies/MNDs contain, among other things: (1) a description of the

² All necessary mitigation measures “must be specifically set forth at the time of publication of a mitigated negative declaration in advance of the City’s adoption of it.” (Pub. Res. Code § 21022; CEQA Guidelines, § 15072(a); *Quail Botanical Gardens Foundation, Inc. v. City of Encinitas* (1994) 29 Cal. App. 4th 1597, fn. 4.)

³ Moreover, the preparation of an EIS under the National Environmental Protection Act (NEPA) does not eliminate the responsibility of a lead agency to ensure compliance with CEQA. (*Nelson v. County of Kern* (2010) 190 Cal. App. 4th 252, 279.) Relevant here, a lead agency must ensure, among other things, separate discussion, identification and addition of mitigation measures. (CEQA Guidelines, § 15221.) This requirement is consistent with CEQA’s unique *substantive mandate* that public agencies refrain from approving projects with significant environmental effects if “there are feasible alternatives or mitigation measures” that can substantially lessen or avoid those effects. (Pub. Res. Code § 21002.)

SheppardMullin

Lisa M. Gibson
December 27, 2017
Page 5

project including the location of the project; and (2) an identification of the environmental setting. (CEQA Guidelines, § 15063(d).) Notably, NPS' FEIS for the Fort Baker Plan adopted in 2000 stated that a separate planning process for ferry service to Fort Baker would provide "a detailed description of the physical facilities and operational characteristics (*i.e.*, frequency of trips, size of boats, land-side facilities, etc.) of ferry service at Fort Baker..." (Fort Baker Plan FEIS, p. 4-23.) However, as explained below, the PMND provides none of the promised (and legally required) details regarding the proposed ferry service to Fort Baker.

The PMND states that the Project would provide two roundtrip ferry trips between Pier 31 ½ to Fort Baker on weekends only. It further estimates that the ferry would serve a daily average of 250 passengers, and 40,000 annual passengers. (PMND, pp. 17-18, Table 4.) No analysis or evidence, however, is provided to support these passenger estimates. Instead, they appear to be largely based on the Project's alleged limitation of two per day trips on weekends only. However, the PMND imposes no mitigation measure to ensure that no additional ferry trips will be added throughout the life of the Project. To the contrary, the PMND states that the number of ferry trips under the Project, including those to Fort Baker, "are not expected to grow..." (PMND, p. 17, referencing Tables 3 and 4, both of which include Fort Baker). Moreover, the FEIS for the Project confirms that additional ferry trips to Fort Baker will be provided for special events, conferences and water-based programs. (FEIS, pp. 66-67.) These additional ferry trips referenced in the FEIS are neither disclosed nor analyzed in the PMND.

Additionally, the PMND provides no information regarding the frequency of proposed ferry trips to Fort Baker, the type of ferry vessel(s) or the passenger capacity of ferry vessels that will provide this expanded service. This omitted information – which the Fort Baker Plan FEIS stated would be provided with this analysis – is highly material. For example, the Golden Gate Bridge Highway & Transportation District's (District) Spaulding class vessels serving the San Francisco-Sausalito route (and therefore a likely candidate to provide the expanded ferry service to Fort Baker) can accommodate 750 passengers *per trip* – well in excess of the PMND's estimate of 250 *daily* passengers from two roundtrip segments.

The PMND's estimates regarding total Fort Baker ferry passengers are further vague and incomplete in that they are fixed, based on some unspecified time and unspecified conditions, with no consideration or analysis of the potential for growth in visitors over the life of the Project. As an illustration, the FEIS for the Project explains that future capacity for ferry service to Alcatraz Island is based on "forecasted 20% growth in visitors to the site through 2036." (FEIS, p. 11.) The PMND, however, provides no comparable analysis regarding anticipated visitor growth to Fort Baker over time, nor any analysis of resulting impacts from such growth.

Moreover, the PMND states that no "shuttle service" or bike rentals are currently available to arriving passengers at the Fort Baker pier. (PMND, p. 20.) However, no information is provided regarding the availability or potential future availability of these resources for arriving ferry passengers beyond the immediate vicinity of the Fort Baker pier, such as elsewhere within or just outside the park. Additionally, no information is provided regarding the availability or potential future availability of additional means of transportation at the Fort Baker pier, such as private cars, cars-for-hire (*i.e.*, Uber, Lyft, taxis), charters, vans and

SheppardMullin

Lisa M. Gibson
December 27, 2017
Page 6

busses, that might transport arriving passengers elsewhere within the park, to nearby parks such as the Marin Headlands and Muir Woods, or to Sausalito.

The PMND's project description is further deficient because it fails to consider the Project "as a whole;" meaning, all phases of project planning, implementation, and operation, including phases planned for future implementation. (CEQA Guidelines, § 15063(a).) Under this CEQA requirement, a lead agency may not limit environmental disclosure by ignoring the development of other activity that will ultimately result from an initial approval. (*See City of Antioch v. City Council* (1986) 187 Cal. App. 3d 1325 [piecemeal review of development of infrastructure for undeveloped site resulting in negative declaration was improper, even though future development of the site would be examined in later EIRs, because infrastructure extension was approved to allow site to be developed].)

Like the facts in *City of Antioch*, the PMND states that the Project's infrastructure improvements, including expanded ferry service to Fort Baker, are intended to facilitate expanded multi-modal visitor access to Fort Baker and beyond. The PMND states: "[t]he proposed project would improve cross-bay connectivity and accommodate existing and future visitor demand for recreational travel to Fort Baker and the Marin Headlands, thereby enhancing the Golden Gate National Recreation Area's operational effectiveness." (PMND, pp. 7-8 [emphasis added].) The PMND's "cumulative scenarios" analysis similarly acknowledges that recent plan actions implemented by the NPS include "improving multimodal connections between the Marin Headlands and Fort Baker by improving roadway surfaces and configurations...directional signage and safety." (PMND, p. 25.) The PMND's project description (and the PMND's analysis of potential environmental impacts) therefore should encompass the Project's broader, existing plans to expand multi-modal transportation of visitors to nearby parks and other regional destinations.

Finally, the PMND's description of the Project's environmental setting is incomplete and misleading. A proper description of a project's environmental setting is critical for informed assessment of its potential environmental impacts. (CEQA Guidelines, § 15064(b); *Leonoff v. Monterey County Bd. of Supervisors* (1990) 222 Cal. App. 3d 1337.) The PMND's description of the environmental setting is deficient in at least two respects.

First, the PMND refers to a variety of "operational and physical constraints, including limited parking at Fort Baker." (PMND, p. 20, *see also* Figure 9.) However, no additional information is provided to describe the environmental setting in the vicinity of the Fort Baker pier, such as photographs, maps, plans or diagrams of this Project site. Absent this basic information regarding the Fort Baker pier environmental setting (*i.e.*, the location and capacity for parking, location and capacity for vehicle and/or bus pickups and drop offs, location and capacity for queuing, and location and capacity of access routes for circling the vicinity), the public may not meaningfully assess the Project's potential traffic and circulation impacts adjacent to the Fort Baker pier and along Moore Road resulting from vehicles queueing and/or circling to pick up or drop off ferry passengers.

Second, based on the PMND's erroneous assumption that all Fort Baker ferry passengers would not leave the confines of Fort Baker, the PMND provides a truncated

description of the environmental setting potentially affected by the Fort Baker ferry service, limited to the vicinity immediately surrounding the Fort Baker pier. The PMND's description of the Project's environmental setting therefore is incomplete and inadequate because it must include, at a minimum, Alexander Avenue, the Marin Headlands and Sausalito – each of which will be effected by the proposed Fort Baker ferry service. The PMND's truncated and incomplete description of the Project's environmental setting potentially impacted by the Fort Baker ferry service precludes meaningful public consideration of the Project's potential environmental impacts. For example, the PMND fails to inform the public of the Project's heightened potential to cause significant impacts in Sausalito in light of existing, over-crowded conditions, as described in detail in Sausalito's Second Addendum to the Golden Gate Bridge Highway & Transportation District's 2012 Initial Study/Mitigated Negative Declaration for the Sausalito Ferry Terminal, dated October 4, 2017. (enclosed as **Exhibit A**).

C. The PMND's Analysis of Traffic and Circulation Impacts Is Deficient

The PMND's Traffic and Circulation impacts analysis is limited to the immediate vicinity of the Fort Baker pier and the proposed new pedestrian walkways within the park. The PMND states: "[t]he proposed project would not result in change to roadways or visitors accessing the park by auto, transit, or bicycle. Therefore, the setting discussion is limited to the pedestrian resources." (PMND, p. 64.) Based on the flawed assumption that no Fort Baker passengers will leave the confines of Fort Baker, the PMND concludes that the Project will not generate any additional traffic trips. The PMND thus states: "[t]he proposed project activities at Fort Baker involve no substantial changes to the roadway network and are not anticipated to generate any new vehicle trips on the local roadways. Therefore, the vehicle and circulation impacts at the Fort Baker site and vicinity would also be less than significant." (PMND, p. 71 [emphasis added].) As will be shown, the PMND's assumptions are unsupported and unsupportable by substantial evidence. To the contrary, substantial evidence supports a fair argument that Fort Baker ferry passengers will travel outside Fort Baker throughout the region. Notably, the NPS's FEIS for the Fort Baker Plan states in relevant part:

Increased visitation at Fort Baker would increase the demand for lodging, restaurant, and other tourist-oriented services in surrounding areas, especially in Sausalito, Tiburon and San Francisco. This business growth, combined with other park improvements, would potentially increase demand for local hotels. (Sedway Group 1980.)

(Fort Baker Plan FEIS, p. 5-4.) Thus, the NPS' prior FEIS alone constitutes substantial evidence supporting a fair argument that Fort Baker ferry passengers will travel beyond Fort Baker to Sausalito and other regional destinations.

The PMND's assumption that Fort Baker ferry passengers will remain within Fort Baker is largely premised on the statements that "no shuttle service" or bike rentals are currently available in the vicinity of the Fort Baker pier to serve arriving Fort Baker ferry passengers. (PMND, pp. 64, 79). However, the PMND imposes no mitigation measures to ensure that either

existing condition at the Fort Baker pier remains unchanged throughout the life of the Project.⁴ Moreover, contrary to the PMND's apparent conclusion, the unavailability of shuttle bus services for arriving passengers is *not* evidence mitigating the Project's potential impacts, but instead by itself constitutes substantial evidence supporting a fair argument that the Project may have significant environmental impacts. In the absence of available shuttle services, arriving Fort Baker ferry passengers will resort to individual vehicles for hire (*i.e.* Uber, Lyft, taxis) to transport them within and outside the park. The PMND's apparent assumption that the unavailability of shuttle services leaves arriving ferry passengers without vehicle transport simply ignores the realities of the modern, smart-phone carrying world.⁵ Fatally, the PMND does not consider, much less mitigate the virtually certain significant impacts resulting from numerous vehicles queueing and circling the vicinity of the Fort Baker pier to pick up or drop off ferry passengers. Nor does the PMND consider, much less mitigate the virtually certain significant impacts resulting from this same parade of vehicles meandering throughout Fort Baker and along Alexander Avenue, transporting ferry passenger/visitors to the Marin Headlands, Sausalito and other regional destinations.

D. Several Of The PMND's Environmental Impact Findings Are Premised On The Flawed Assumption That Fort Baker Ferry Passengers Will Not Leave Fort Baker

The PMND's analysis and findings regarding the Project's potential to cause several additional environmental impacts likewise is premised upon the PMND's flawed assumption that all Fort Baker ferry passengers would remain on foot within the park, and therefore generate no additional traffic trips. The following categories of analysis in the PMND are legally deficient for this reason, among others.

Aesthetics. Because the PMND assumes that all Fort Baker arriving passengers will remain within Fort Baker as pedestrians, the PMND's aesthetic analysis is truncated, and limited in scope to potential scenic vista impacts in the immediate vicinity of the Fort Baker pier resulting from: "[o]perationally, intermittent ferry service to the pier..." (PMND, pp. 39-40.) The PMND therefore provides no analysis of aesthetic impacts on scenic vistas from vehicles queueing and/or circling near Fort Baker pier to pick up and drop off ferry passengers. Nor does it analyze aesthetic impacts on scenic vistas from additional pedestrian, bicycle and vehicular

⁴ Even if existing conditions adjacent to the Fort Baker pier were enforceable for the life of the Project, the PMND does not address, much less impose any constraints on rental bicycle outlets from locating elsewhere within Fort Baker or just outside the park, which would enable Fort Baker ferry passengers to travel by bicycle to nearby parks and Sausalito – exacerbating existing, over-crowded conditions.

⁵ Equally puzzling is the PMND's suggestion that Fort Baker ferry passengers' purchase of a roundtrip ticket will constrain visitors to the confines of Fort Baker. Here again, the PMND does not consider, much less account for the likelihood of ferry passengers arriving at Fort Baker on a Saturday ferry, but then returning on a Sunday ferry to allow time for travel to Sausalito and other regional locations. It is equally plausible that Fort Baker ferry passengers will simply forego use of their return ticket and instead purchase a separate return ticket from the Sausalito ferry, or return to San Francisco by private car or other mode of transportation.

SheppardMullin

December 27, 2017
Page 9

traffic from Fort Baker ferry passengers traveling through Fort Baker, along Alexander Avenue, to and within nearby parks such as the Marin Headlands and Muir Woods, and to and within Sausalito's historic downtown and waterfront.

Noise. The PMND's analysis of potential noise impacts from Fort Baker ferry operations likewise is limited in scope to impacts on receptors in the immediate vicinity of the Fort Baker pier resulting from intermittent ferry service. (PMND, pp. 87-88.) The PMND thus provides no analysis of potential noise impacts from vehicles queuing and circling the Fort Baker pier vicinity to pick up and drop off ferry passengers. The PMND similarly fails to analyze potential noise impacts from Fort Baker ferry passengers traveling by various modes of transportation outside of Fort Baker, along Alexander Avenue to nearby parks, Sausalito and other regional destinations.

Air Quality. The PMND's analysis of air quality impacts likewise is premised on the flawed assumption that no vehicle trips will be generated by Fort Baker operations. (PMND, p. 110.) The PMND thus provides no analysis of air quality impacts from increases in vehicular traffic from Fort Baker ferry passengers traveling within the Fort Baker and beyond along Alexander Avenue, to nearby parks, Sausalito and other regional destinations.

Greenhouse Gas Emissions. The PMND's analysis of Greenhouse Gas Emissions likewise is premised on the flawed assumption that "[m]obile source emissions, which represent the bulk of operational greenhouse gas emissions, would, however, all originate from the Pier 31 ½ site; there would be no new ferry trips or vehicle trips originating from Fort Baker as a result of the proposed project." (PMND, p. 117.) The PMND thus provides no analysis of greenhouse gas impacts from idling ferries docked at the Fort Baker pier while passengers load and unload, queuing and circling vehicles picking up or dropping off ferry passengers, or the additional vehicular traffic from Fort Baker ferry passengers traveling to nearby parks, Sausalito and other regional destinations.

Recreation. The PMND's analysis of Recreation impacts likewise is premised on the flawed assumption that "[v]isitors arriving by ferry from the primary embarkation site are not expected to leave Fort Baker so they would not cause an increase in the use of existing parks and recreational facilities in the area." (PMND, p. 120.) The PMND thus provides no analysis of potential recreation impacts from Fort Baker ferry passengers traveling to nearby parks, including the Marin Headlands, Muir Woods, and multiple parks located along Sausalito's historic waterfront – adding to existing, over-crowded conditions.

Public Services. Here too, because the PMND assumes that Fort Baker ferry passengers will not leave Fort Baker, it provides no analysis of the Project's potential impacts on police and fire public services as well as emergency response times resulting from increased pedestrian, bicycle and vehicular traffic along Alexander Avenue, within the nearby parks and Sausalito. (PMND, pp. 127-128.)

E. The PMND Fails To Adequately Analyze Potential Land Use and Regulatory Consistency Impacts

Lead agencies under CEQA must analyze a project's potential to cause significant land use and planning impacts. A project may cause significant land use impacts where, among other things, it conflicts with any applicable land use plan, policy or regulation of an agency with jurisdiction over the project accepted for the purpose of avoiding or mitigating an environmental effect; or conflicts with any applicable habitat conservation plan or natural communities conservation plan. (CEQA Guidelines, Appendix G.)

The PMND concludes that the Project is compliant with all "relevant" regulations under the Clean Water Act, Endangered Species Act, Bay Plan and McAteer-Petris Act. (PMND, p. 36.) This analysis, however, is incomplete because it fails to consider whether the proposed Fort Baker ferry service complies with applicable legal requirements under the Coastal Zone Management Act (CZMA) (16 U.S.C. § 1451 *et seq.*) and the Marine Mammal Protection Act (MMPA). (16 U.S.C. §§ 1372, 1374.).

The CZMA requires that "each Federal agency activity within or outside the coastal zone that affects any land or water use or natural resource of the coastal zone shall be carried out in a manner which is consistent to the maximum extent practicable with the enforceable policies of approved State management programs." (16 U.S.C. § 1456(c)(1)(C).) A federal agency ensures consistency of its actions with a state management program by submitting a consistency determination to the relevant state agency. (*Ibid.*) After receipt of the consistency determination, the "State agency shall inform the Federal agency of its concurrence with or objection to the Federal agency's consistency determination." (15 C.F.R. § 930.41). The PMND, however, provides no analysis nor evidence of the Project's compliance with the CZMA's requirements.

Under the MMPA, it is unlawful to "take" a marine mammal without a permit. (16 U.S.C. §§ 1372, 1374.) Under this statute, "take" means "harass, hunt, capture, or kill" or attempt to "harass, hunt, capture, or kill." (*Ibid.*) The MMPA defines "harassment" as "any act of pursuit, torment, or annoyance which: (i) has the potential to injure a marine mammal or marine mammal stock in the wild; or (ii) has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including but not limited to, migration, breathing, nursing, breeding, feeding or sheltering." (*Id.* § 1362(18)(A).)

The PMND acknowledges that construction activity at the Fort Baker pier could annoy marine mammals and cause them to change course to avoid the construction area. The PMND, however, contains no mitigation measures to reduce impacts to marine mammals to less than significant. It provides instead only an "Improvement Measure," which states in relevant part:

If marine mammals enter the safety zone after pile driving of a segment has begun, *pile driving will continue*. The biologist will monitor and record the species and number of individuals observed, and make note of their behavior patterns. If the animal appears distressed, *and if it is operationally safe to do so*, pile driving will cease until the animal leaves the area.

(PMND, p. 184. [emphasis added]) Thus, although the PMND acknowledges that Project construction activity *will proceed* in many cases, notwithstanding clearly visible annoyance and disruption of marine mammal behavior patterns, the PMND provides no analysis nor explanation regarding why such Project activity would not constitute a “take” under the MMPA.

F. The PMND Fails To Adequately Analyze And Mitigate Potential Hazards, Pollutants and Water Quality Impacts

The FEIS for the Fort Baker Plan previously noted that the provision of ferry service to Fort Baker could increase turbidity and the amount of petroleum pollutants present in Horseshoe Bay resulting in potential adverse impact to water quality. (Fort Baker Plan FEIS, p. 4-23.). The PMND, however, concludes that the Fort Baker ferry service will have less than significant impacts either because the Project will comply with all “applicable” Federal, state and local requirements and regulations; or alternatively, plans will be “developed” to identify and mitigate potential impacts. Both approaches, however, violate CEQA.

The PMND repeatedly finds that the Fort Baker ferry service will have no impacts or less than significant impacts because the Project will comply with “applicable” Federal, state and local requirements and regulations. For example, while the PMND acknowledges that “[f]erry operations have the potential to impact water quality from potential pollutant discharges of hazardous materials, including chemicals and solvents used onboard, boat cleaning and maintenance materials, fuels, bilge or ballast water, sewage from toilets, and gray water, and trash from passengers and visitors,” it concludes that such impacts would be less than significant because operations at Fort Baker “would adhere with plans and policies designed to address potential water quality impacts.” (PMND, pp. 157-158.) The PMND further states that Project impacts would be less than significant because:

- Vessel fueling would adhere to Coast Guard regulations;
- Any spills would be “cleaned up immediately using spill response equipment as identified in the Spill Prevention Control and Countermeasure Plan;
- Discharges and quantities of ballast water would occur in compliance with “federal and state regulations, including the Vessel General Permit and Ballast Water Management for Control of Nonindigenous Species Act; and
- Sanitary sewage ferries would be subject to the requirements of the MARPOL convention and Section 312 of the Clean Water Act; and
- Due to the proximity of Pier 31 ½ and Fort Baker to the Bay, litter from visitors at the site could potentially enter the bay. The ferry operator would be responsible for implementation of a trash collection and management program, and waste management at both proposed project sites would proceed in accordance with all applicable federal, state and local regulations for waste management disposal.”

(PMND, pp158-159.)

The foregoing less-than-significant impact findings, however, are unsupported by substantial evidence and violate CEQA because they are premised on conditions and assumptions regarding the Project's future compliance with legal requirements that are not imposed on the Project as legally enforceable mitigation measures. (See PMND, p. 155 [no mitigation measures identified for Hydrology and Water Quality Impacts].) The PMND thus violates CEQA's substantive mandate to impose feasible and enforceable mitigation measures to *ensure* that a project's environmental impacts remain less than significant throughout the life of the project.

Adding to the foregoing legal deficiencies, the PMND's analysis of hazards and water quality impacts also relies on deferred "development" of plans to identify future mitigation measures. For example, the PMND states:

The Park Service would prepare a Stormwater Pollution Prevention Plan for operations at Fort Baker. The Stormwater Pollution Plan Prevention Plan would identify pollutant sources within the site and provide site-specific best management practices regarding control of sediments in runoff and storage and use of hazardous materials to prevent discharge of pollutants into stormwater.

(PMND, p. 158.) The PMND thus concludes that: "[w]hile the proposed project would result in a minor increase in the number of ferry trips... and would introduce limited ferry service to Fort Baker, *development of required plans* and compliance with regulations as detailed above would ensure that water quality impacts associated with long-term operations of the proposed project would be less than significant." (PMND, p. 159.)

Here, the PMND's reliance on *future* "plans" to be "developed" to mitigate the Project's potential impacts contravenes CEQA's prohibition of "deferred" mitigation. Under CEQA, "formulation of mitigation measures should not be deferred until some future time" as this frustrates review by the public. (CEQA Guidelines, § 15126.4(a)(1)(B); *Gentry v. City of Murrieta*, *supra*, 36 Cal. App. 4th at 1393).

G. The PMND Fails To Adequately Analyze and Mitigate Potential Growth-Inducing Impacts

CEQA requires that lead agencies describe any growth-inducing impacts of the proposed project. (Pub. Res. Code § 21100(b)(5); CEQA Guidelines, § 15126(d).) Lead agencies must discuss the ways in which the project could directly or indirectly foster economic or population growth or the construction of new housing in the surrounding environment. (CEQA Guidelines, § 15126.2(d).) The discussion should also include characteristics of the project that may encourage and facilitate other activities that could have a significant effect on the environment, either individually or cumulatively. The CEQA Guidelines explain that projects, like the Fort Baker ferry service aspect of the Project, that make improvements to infrastructure, are more likely to be growth-inducing. (CEQA Guidelines, § 15126.2(d).)

As noted above, the NPS' FEIS for the Fort Baker Plan concluded that the increase of visitors to Fort Baker would cause growth-inducing impacts in the surrounding area, including Sausalito. (Fort Baker Plan FEIS, p. 5-4.) This evidence alone constitutes substantial evidence

SheppardMullin

Lisa M. Gibson
December 27, 2017
Page 13

supporting a fair argument that the Fort Baker ferry service may cause significant growth-inducing impacts. Yet despite the NPS's previous acknowledgment of potential significant impacts, the PMND provides no analysis whatsoever of the Fort Baker ferry service's potential to cause growth-inducing impacts in Sausalito or elsewhere within the region. (PMND, p. 44.)

CONCLUSION

Because as shown, the PMND's analysis and findings are legally deficient in numerous respects, and because substantial evidence supports a fair argument that the proposed Fort Baker ferry service may cause several significant impacts, the City may not lawfully approve the PMND, and instead must prepare an EIR.

We encourage the City and NPS to consult and work cooperatively with Sausalito henceforth regarding any proposal to expand ferry service to Fort Baker. As shown above, such consultation is required under CEQA. That approach also is consistent with past practice and NPS' previous commitment to Sausalito. The NPS' Record of Decision (ROD) for the Fort Baker Plan and Final EIS adopted nearly two decades ago states that "[t]he NPS is specifically committed to working with the City of Sausalito, Marin County Congestion Management Agency, the Golden Gate Bridge, Highway and Transportation District, Caltrans and the Metropolitan Transportation Commission..." to seek "regional solutions to transportation challenges in the areas surrounding Fort Baker..." (NPS' ROD for Fort Baker Plan and Final Environmental Impact Statement, June 9, 2000, p. 8.)

Sausalito thus requests that the Planning Commission reject the proposed PMND, or alternatively, sever the proposed Fort Baker ferry service from the Project. Sausalito welcomes the opportunity to work collaboratively with NPS and the City to properly and more fully consider, analyze and mitigate potential impacts to Sausalito and the region resulting from an expansion of ferry services to Fort Baker.

Very truly yours,

Arthur J. Friedman

MEMORANDUM

DATE: October 4, 2017

TO: Adam Politzer, City Manager

FROM: Judith H. Malamut, ACIP, Principal

SUBJECT: Second Addendum to the 2012 Initial Study/Mitigated Negative Declaration and 2017 Addendum for the Sausalito Ferry Terminal

1.0. Introduction

The Golden Gate Bridge, Highway and Transportation District (District) proposes to remove the existing ferry landing in Sausalito (City) and build a new ferry landing (Project). On December 14, 2012, the District in its dual capacity as Project proponent and lead agency under California's Environmental Quality Act (CEQA) adopted the Golden Gate Sausalito Ferry Terminal Vessel Boarding Rehabilitation Project Initial Study/Mitigated Negative Declaration (MND) to analyze and identify measures to mitigate the Project's potential environmental impacts. Subsequent to the District's adoption of the MND, the District modified the Project in several respects. To address these Project changes as well as certain identified changed circumstances, the District prepared and adopted an Addendum to the MND on May 26, 2017 (District Addendum).

The Project is located on the shoreline of the City's historic downtown waterfront on lands held by the City as trustee for the State under California's Public Trust Doctrine.¹ The District operates the ferry landing under the authority and pursuant to the terms of a Lease Agreement dated December 1, 1995 between the City as Lessor and the District as Lessee (Lease). Under the terms of the Lease, the District must obtain the City's written consent to the Project. On August 31, 2017, the District submitted the Project to the City for its consent under the Lease.

The City is a Responsible Agency under CEQA because it has discretionary approval authority over the Project. As a Responsible Agency, the City has prepared this Second Addendum to the MND to analyze the Project's potential impacts in light of substantial changes that have occurred with respect to the circumstances under which the Project is to be undertaken arising from significant increases in the volume of ferry passengers with bicycles, primarily during peak periods spanning

¹ See Aerial Photograph of Project area attached as Exhibit 1.

from March through October. While the Project has the potential to cause significant environmental impacts in light of these new circumstances, these potential impacts are reduced to a less-than-significant level with the implementation of the mitigation measure identified herein.

2.0 Project Background and Changed Circumstances

The District operates ferry services between San Francisco and Sausalito in southern Marin County. The proposed Project would increase the size of the existing ferry terminal, in part to facilitate anticipated passenger volume growth in the future. The size of the proposed float would increase from 110' long x 42' wide to 144' long and 49' wide. The size of the gangway would increase from 70' long x 5.9 wide to 90' long x 12' wide.

Subsequent to the District's adoption of the MND in December 2012, substantial changes occurred with respect to the circumstances under which the Project is to be undertaken because of significant increases in the number of ferry passengers with bicycles, primarily tourists, during peak periods primarily spanning from March through October. Based on data provided by the District, in 2012, monthly ferry passengers with bicycles averaged 9,200, with a high mark of 16,469 in July. By 2014, monthly ferry passengers with bicycles averaged 16,007, with a high mark of 29,796 in August.² A report prepared by the District dated March 11, 2015 for the City's Joint Planning Commission and Historic Landmark Board Study Session states "during the peak season, weekday highs at Sausalito reach up to 3,500 passengers per day and weekend highs reach up to 6,000 passengers per day. During peak days, 33% to 50% of riders have bicycles, which results in delays associated with loading and unloading of passengers...."³

This significant increase in ferry passengers with bicycles has resulted in long queues for the ferry that periodically extend from the ferry pier, southward to El Portal Street, up Tracy Way, then turning the corner to the north and spanning Anchor Street, extending as far as the Spinnaker parking lot.⁴ The number of passengers with bikes standing in the ferry queue during a peak day can range from 1,700 to 3,500 people.⁵ Passengers arrive as early as 11:00 a.m., with the greatest volume arriving between 1:00 to 4:00 p.m. During peak periods, long queues are common from 2:00 p.m. to 6:00 p.m.

The primary locations of congestion, blocked access, conflicts and safety issues between passengers with bikes waiting to board the ferry, passengers leaving the ferry, pedestrians, mobility impaired citizens, and vehicles, occurs primarily in the following locations:

- ² Golden Gate Ferry Sausalito Bike Counts" chart provided by the District on August 11, 2016 (Exhibit 2).
- ³ Golden Gate Bridge, Highway and Transportation District Sausalito Ferry Terminal Improvement Project, District report dated March 11, 2015, at p. 3 (Exhibit 3).
- ⁴ Yellow Highlighted illustration of extent of Queue at Exhibit 4 and photographs of queue conditions at Project Site from Bicycle Committee Presentation dated February 28, 2017 (Exhibit 5).
- ⁵ Fotsch, Deborah. Executive Director of Sausalito Plus and Member of the Sausalito Congestion Management Working Group. 2017. Update on Crowd Management Challenges Related to Tourist Bikes and Ferry Queue, October 3, 2017 (Exhibit 6)

- At the end of the ferry terminal ramp where passengers with bikes block disembarking passengers from turning to the left toward the Downtown and force them to walk through the parking lot creating conflicts and safety concerns with vehicles parking and leaving the lot.
- At the ferry ticket kiosk where passengers with bikes line up to buy ferry tickets blocking the street and sidewalk and the parking lot kiosks.
- On all the sidewalks identified above, and especially along Tracy Way, where the passengers with bikes queue is located and which blocks the sidewalks to such a degree that Sausalito residents and other visitors cannot use the sidewalks and have difficulties passing through the queue as the bikes create a kind of fence-like barrier. Passengers and pedestrians then stand in or walk along the streets (especially Anchor Street) and within the parking lot itself interfering with vehicular and bike circulation.
- At and within the intersection of Tracy Way and El Portal Street as well as Tracy Way and Anchor Street.
- The areas accessible to persons with disabilities at the north and south corners of the parking lot at Tracy Way are completely blocked by the bicyclist queue leading to conflicts, safety issues and confusion for visitors who have parked and want to access the Downtown.
- At the vehicle ingress and egress locations for the parking lot which are often blocked by passengers and within the parking lot itself which becomes congested with disembarking ferry passengers, passengers with bikes cutting through the lot to reach the ticket kiosk, and vehicles entering, exiting and parking within the lot.

Because of the congestion and potential public safety issues identified above, crowd management of ferry passengers has been provided by City Department of Public Works, Sausalito Plus and the City's Police Department. These demands placed on City officials and the City's Police Department reduce the City's ability to provide police and other services to other areas of the City during these peak times. The District has not provided sufficient staff and resources to manage the queues, and has not provided sufficient mitigations to address these changed conditions.⁶ The City's Chief of Police, John Rohrbacher, submitted a report dated September 25, 2017 to the City Manager describing the need for improved queue management from the District to mitigate the dangerous situation that exists when the queue spills into the City's adjacent parking lot, blocking traffic, increasing congestion and placing pedestrians in danger.⁷

To reduce the number of passengers with bikes blocking City facilities and through traffic, the City has closed Tracy Way to public access and has been using it to provide bicycle storage and parking. This effort to reduce the passenger bike queue congestion and nuisance on other public facilities,

⁶ Polltzer, Adam. City Manager, City of Sausalito. Fotsch, Deborah, Rohrbacher, John. 2017. Personal Communication with Judith Malamut, LSA Associates, Inc. September 26.

⁷ Letter dated September 25, 2017 from Chief of Police John Rohrbacher to City Manager Adam Polltzer. (Exhibit 7).

has led to the closure of Tracy Way and the elimination of 14 public parking spaces for the City of Sausalito residents, and other facilities (streets, intersections, sidewalks and public parks) continue to be crowded with ferry passengers with bikes. The City has also taken a number of additional steps to manage the congestion created in the downtown area including:

- Adopting regulations to impound bikes in place.
- Establishing a downtown bike parking zone.
- Establishing free bike parking areas in lot adjacent to municipal parking lots including repurposing seating areas along Bridgeway and lot 3.
- Reconfiguration of Parking Lot 1 to increase the queuing area, by eliminating 4 parking spaces and removing the circulation island for exiting cars.
- Reconfiguration of vehicular circulation on El Portal.
- Additional law enforcement officers to cite and enforce bike parking downtown.
- Replacement and end expansion of the downtown public restroom
- Establishment of an ambassador program to direct bicyclist to parking and to the ferry landing.
- Contracting with Sausalito Bike Return to operate a bike return program which utilizes space in municipal lot 1 to operate service.

3.0. Purpose of the Addendum

The City is a responsible agency for the Project under CEQA. Responsible agencies are those public agencies, other than the lead agency, which have responsibility for carrying out or approving a project, or which have discretionary approval power over a project for which the lead agency has prepared an EIR or negative declaration. (Pub. Res. Code § 21069; CEQA Guidelines, § 15381.)

The City is a responsible agency because it has discretionary approval authority for the Project pursuant to its right of consent under the Lease. Additionally, the Project includes both temporary and permanent components located outside of the current leased premises which require a lease amendment and/or encroachment agreements from the City. Finally, the City has discretionary authority over the Project as Trustee for the Project Site under the Public Trust Doctrine.

CEQA Guidelines Section 15096 requires that responsible agencies consider the adequacy of the Project's EIR or negative declaration prior to granting any discretionary approvals. Under Section 15096, subsection (e), if the responsible agency determines that the EIR or negative declaration is not adequate for use by the responsible agency, it must prepare the appropriate level of additional environmental analysis prior to granting any discretionary approvals.

The District's Addendum acknowledges that existing ferry operations at the Project site are "exacerbated by the large number of bicyclists using the southbound ferry (i.e., from Sausalito to

San Francisco), who require additional time and space to load, safely stow, and then offload bicycles.”⁸ The District’s Addendum further explains that “lack of sufficient queueing space at the existing ferry terminal has caused waiting southbound passengers to overflow onto the City of Sausalito’s (City) landside ferry plaza and adjacent parking lot.” The Addendum further explains that “in order to maintain operating schedule, southbound ferries occasionally leave passengers in Sausalito during peak times...” (*Id.* at p. 2-2). The District’s Addendum, however, does not analyze the Project’s potential impacts in light of these change circumstances, nor analyze the Project’s potential to facilitate increases in the volume of future passengers and therefore exacerbate existing queue and crowd conditions.

This Second Addendum has been prepared pursuant to CEQA Guidelines Section 15164, subsection (b), which provides that a lead agency or responsible agency may prepare an addendum to an adopted negative declaration if only minor or technical changes or additions are necessary or none of the conditions described in Section 15162 calling for the preparation of a subsequent EIR or negative declaration have occurred.” Section 15162 specifies that “no subsequent EIR shall be prepared for that project unless the lead agency determines ... one or more of the following”:

1. Substantial changes are proposed in the project which would require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;
2. Substantial changes occur with respect to the circumstances under which the project is undertaken which would require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or
3. New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete was adopted, shows any of the following:
 - (A) The project would have one or more significant effects not discussed in the previous EIR;
 - (B) Significant effects previously examined would be substantially more severe than shown in the previous EIR;
 - (C) Mitigation measures or alternatives previously found not to be feasible would in fact be feasible and would substantially reduce one or more significant effects of the project, but the project proponents decline to adopt the mitigation measure or alternative; or
 - (D) Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant

⁸ Final Sausalito Ferry Terminal Vessel Boarding Rehabilitation Project – Addendum to the Initial Study/Mitigated Negative Declaration, May 2017, at p. 1-2.

effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative.

Although the substantial increases in the number of ferry passengers with bicycles and resulting long queues into the City's adjacent facilities, including streets, sidewalks, promenades, public parks and parking lots, constitutes a substantial change with respect to the Project's circumstances, this change does not require major revisions to the previous MND and District's Addendum. Pursuant to CEQA Guidelines Section 15164, subsection (e), this Second Addendum explains the City's decision to not prepare a subsequent EIR or negative declaration pursuant to Section 15162, analyzes the Project's new, potentially significant impacts in light of changed circumstances at the Project site since the District's adoption of the MND, which were not analyzed in the District's Addendum, and identifies mitigation measures to reduce these new, potential impacts to a less-than-significant level.

4.0 Evaluation of Environmental Impacts

Evidence supplied by the District indicates that the Project encourages and facilitates future increases in the volume of ferry passengers with resulting impacts from the ferry queue and overcrowding conditions. On August 11, 2016, the District acknowledged in a statement provided to the City that "the District's mission is to encourage ferry ridership to reduce traffic along the 101 corridor."⁹ The District designed the Project to facilitate and accommodate projected passenger volume growth through the year 2029, premised on 4% ferry passenger growth per year. The District's design calculations assumed at an 85-percentile volume (meaning the anticipated volume would exceed this benchmark 15% of the time) the disembarking and embarking of 920 passengers per trip, which is substantially greater than current conditions.¹⁰ Finally, during the public meeting before the City Council on September 26, 2017, the District's General Manager testified that after the Project is constructed and permanent operations commence, during peak periods ferry vessels still would periodically be forced to depart to maintain the schedule while would-be-passengers remained in the queue.

After reviewing the analysis contained in the MND and the District's Addendum, the Project's potential impacts in light of the change in circumstances would not require new analysis or modifications relating to the following resources categories: Agriculture and Forestry Resources; Air Quality; Geology, Seismicity and Soils; Greenhouse Gas Emissions; Hazards and Hazardous Materials; Hydrology and Water Quality; Mineral Resources; Noise; Population and Housing; Utilities and Infrastructure.

This analysis will focus on impacts related to the following topics

- Aesthetics and Visual Resources
- Land Use and Planning;

- Public Services (Police);
- Recreation; and
- Transportation and Traffic.

A. AESTHETICS AND VISUAL RESOURCES

The MND and the District's Addendum analyzed impacts associated with aesthetics and visual resources concerning the construction of the Project, but did not address impacts to visual and scenic resources related to the passengers with bikes in long queues and related crowd congestion. Because of the changed circumstances, scenic vistas of the San Francisco Bay available from the public sidewalks and promenades along the Sausalito waterfront in the vicinity of the ferry landing are currently blocked by the length, character and congestion associated with the queue such that the public cannot access these vantage points. Additionally, the length, duration and character of the queue substantially degrades the existing visual character and quality of the area in the vicinity of the ferry landing including Gabrielson Park. Restricting the physical location of the queue to a designated area would mitigate these impacts to a less-than-significant level. The City therefore has identified the following mitigation measure:

Mitigation Measure AES-1: Commencing with permanent operations and continually thereafter, the District shall manage the queue for the Ferry Landing, which may span from the Ferry Landing Pier Southward along the side of the existing hedge towards El Portal Street, terminating at El Portal Street (Queue Area). The District shall implement all reasonable and necessary measures to prevent any queue for the Project from extending beyond or outside the Queue Area.

Exhibit 10 shows the location where the passengers and passengers with bikes shall be located per Mitigation Measure AES-1. Implementation of this mitigation measure would confine the queue to a limited and acceptable location and therefore reduce aesthetic impacts to the visual character, scenic vistas and viewpoints to a less-than-significant level.

B. LAND USE AND PLANNING

The MND and the District's Addendum analyzed impacts associated with land use and planning and determined that the Project would not conflict with adopted plans and policies. However, the analysis did not take into account the adverse effects of the increased numbers of passengers with bikes and crowded conditions on existing City uses and facilities including the municipal parking lots, City streets, sidewalks, and public parks, as identified above. The effect of the long passenger queues and congestion is to substantially limit the public's use and availability of these facilities and access to that portion of the City. Implementation of Mitigation Measure AES-1 would reduce these impacts to a less-than-significant level by requiring the District to manage the queue and by confining the queue to a limited and acceptable area.

C. PUBLIC SERVICES

As stated above, the City has been providing public services, and especially police services to manage the overcrowding, congestion and bicyclist, vehicular, pedestrian conflicts associated with the passengers with bikes queue. The MND and District's Addendum identified that the Project would have no impact or a less-than-significant impact related to the Project. As stated above, the Project in concert with the new circumstances would result in substantial adverse physical impacts related to the maintenance of acceptable service ratios and response times to other areas of Sausalito during peak ferry times, as police personnel have needed to be on hand to manage the congestions, conflicts and safety issues related to the long queue. Implementation of Mitigation Measure AES-1 would reduce these impacts to a less-than-significant level by requiring the District to manage the queue and by confining the queue to a limited and acceptable area.

D. RECREATION

The MND and the District's Addendum analyzed effects to recreational facilities and determined that there would be a less-than-significant impact on public parks and open space in the vicinity of the ferry terminal. As demonstrated and described above, the Project in concert with the new circumstances would result in substantial adverse physical impacts on public parks and open space. During peak times, Gabrielson Park, Plaza Vina del Mar, Yee Tock Chee Park as well as the waterfront promenade, open space areas and portions of Sausalito's historic downtown are crowded with waiting ferry passengers. This increased use and deterioration of the existing parks and recreational facilities by ferry passenger overcrowding and attendant litter is a potentially significant Project impact that would be reduced to a less-than-significant level with implementation of Mitigation Measures AES-1 by requiring the District to manage the queue and by confining it to a limited and acceptable area.

E. TRANSPORTATION AND TRAFFIC

The MND and the District's Addendum analyzed the effects of the Project on transportation and circulation and found that there would be a less-than-significant impact related to those topics. However, as detailed above, the change in circumstances related to the increase in ferry passengers with bikes causes conflicts with the effectiveness of the circulation system for all modes of travel in the vicinity of the ferry terminal and the passenger bike queue. City streets (especially, El Portal, Tracy Way, and Anchor Street), intersections, sidewalks, access for persons with disabilities from the parking lot, bike lanes, ingress and egress to and circulation within the parking lot, are all congested by ferry passengers with bikes and not operating effectively during peak times. As stated previously, the City has shut down Tracy Way to through traffic and reconfigured vehicular circulation on El Portal and in Municipal Parking Lot 1 in an attempt to manage the congestion caused by the ferry passengers.

Additionally, the change in circumstances and use of City facilities by ferry passengers has resulted in hazardous traffic, circulation and public safety conditions due to the many physical conflicts and accidents among pedestrians, bicyclists, and drivers associated with the long queue and the spillover

of people and bikes into the streets and intersections and parking lot due to the overcrowded conditions.¹¹

Implementation of Mitigation Measures AES-1 would reduce impacts on transportation facilities and service to a less-than-significant level by requiring the District to manage the queue, and by confining it to a limited and acceptable area..

5.0 Conclusion

As a responsible agency for the Project, the City has identified new and potentially significant environmental impacts of the Project in light of changed circumstances arising from the increase in ferry passengers with bikes and the resulting long queues, overcrowding, congestion on City facilities, multi-modal conflicts, public safety issues, and adverse effects on visual resources, land use, public services, recreation, and transportation and traffic. However, implementation of Mitigation Measure AES: 1, supplementing the Project's existing mitigation measures as set forth in the District's Mitigation and Monitoring Program (MMRP) for the Project adopted on December 14, 2012, incorporated herein, would ensure that the Project's impacts are less than significant. The City's supplement to the District's MMRP is provided as Table 1, attached as Exhibit 11.

EXHIBIT 3

Golden Gate Bridge, Highway and Transportation District Sausalito Ferry Terminal Improvements Project

**Prepared for the City of Sausalito Joint Planning Commission and Historic Landmark Board
March 11, 2015, Study Session**

Introduction

The Golden Gate Bridge, Highway and Transportation District (District), operates Golden Gate Ferry, the largest public ferry transit system on the San Francisco Bay, on two ferry routes connecting Marin County and the City and County of San Francisco: the San Francisco/Larkspur route to central Marin County, and the San Francisco/Sausalito route to southern Marin County. Golden Gate Ferry has a fleet of seven (7) vessels and provides weekday passenger service as well as service on weekends and specific holidays. Special service is also offered from Larkspur to AT&T Park in San Francisco for Giants home games and other sporting and music events.

The District has been operating ferry service since 1970. The ferry boarding structures are nearing the end of their useful life and are in need of replacement. The District is proposing to replace the passenger boarding systems at its three facilities located in Larkspur, San Francisco, and Sausalito with structurally improved, ADA compliant and more operationally efficient boarding facilities. No new ferry service or routes are considered in the project design.

The improvements will allow Golden Gate Ferry to continue providing quality public transit across the San Francisco Bay and ease congestion on Highway 101 by reducing the number of motor vehicles traveling between the North Bay counties and San Francisco. The increased use of public transportation decreases the region's dependence upon automobile transportation, thereby reducing the region's overall fossil fuel usage and associated emissions and improving the environmental sustainability of transportation in the region.

Sausalito Ferry

Golden Gate Ferry currently provides 22 weekday summer crossings and 17 weekend summer crossings between Sausalito and San Francisco. For the fiscal year ending June 30, 2014 (FY14), the Sausalito/San Francisco patronage totals 793,192 riders, a 10.4% increase over the previous FY13 patronage totals. Weekday average ridership was 1,944 and average weekend ridership was 2,758. In 2014, during the peak summer season, ferry sailings from Sausalito to San Francisco carried up to 600 passengers per trip.

In addition to Golden Gate Ferry service, the Blue & Gold Fleet operates ferry service between San Francisco Pier 41 and the Sausalito Ferry Terminal. This provision for Blue & Gold use of the Sausalito Ferry Terminal was mandated by the CPUC Order No. 82-01-02 in 1982. Blue & Gold operates service for passengers, including those with bicycles, and is currently the only ferry service that can accommodate electric bicycles.

Location and Existing Conditions

The proposed project will occur at the location of the existing Golden Gate Sausalito Ferry Terminal, on the eastern waterfront of the City of Sausalito. The existing Sausalito Ferry Terminal is located within the San Francisco North Quadrangle, at approximately 37° 51' 22" N; 122° 28' 39" W. The project site lies east of

Golden Gate Bridge, Highway and Transportation District
Sausalito Ferry Terminal Improvements Project

the intersection of Bridgeway and El Portal/Anchor Street and is accessible from Bridgeway with connections through El Portal, Anchor Street, Tracy Way, and Humboldt Avenue (see **Exhibit 1**). The project site is owned by the City of Sausalito. The District has constructed and operates the ferry terminal under a long term lease agreement with the City of Sausalito. The 51,402 square foot lease area extends from the landside around the existing pier and into the water, primarily within Marin County Assessor's Parcel Number (APN) 065-073-035, although the southern portion of the lease area extends into APN 065-133-22 (see **Exhibit 2**). The project site comprises 0.495 acre (21,571 square feet) within BCD's Bay jurisdiction.

The site consists of tidal open waters within the Bay and a small linear area at the landside interface, which contains the concrete pier connecting to the City's landside Ferry Plaza area. This area contains the ticket vending machines, ferry schedule boards, news racks and welcome to Sausalito sign. The remaining landside areas, including tidal stairs and the City's Ferry Plaza are outside the ferry terminal leased area.

Bathymetry within the open waters of the site range from 0 feet MLLW where the terminal meets the shore, to -25 feet MLLW at the eastern end of the float. The shoreline consists of large rock riprap with limited seaweed growth below mean sea level (MSL). There are no eelgrass beds or oyster beds within the project site. A sheer, roughly 15-foot-high concrete wall with a tidal stair cut-out defines the transition between open water, shoreline, and the landside. The landside is developed as the City of Sausalito's Ferry Plaza, a highly used seating and walking area for both residents and tourists.

The existing boarding system consists of a 110-foot long by 42-foot wide steel float, a 70-foot long by 5.5-foot wide steel gangway, and an approximately 96.5-foot long by 8.5-foot wide pile-supported timber and concrete access pier. This access pier connects to a 95-foot-long x 20.5-foot-wide landside pier. The existing boarding system extends from the landside developed areas, over the shoreline, and to the open water where the float is located. The landside pier has a passenger control point that is demarked by a locked gate. Only paying ferry passengers may access the access pier beyond the gate, which is opened by crew members when a vessel arrives at the ferry terminal. **Exhibit 3** is an aerial view of the project site, the existing ferry terminal, and the proposed project footprint. **Exhibit 4** illustrates typical passenger use of the existing ferry terminal, including bicyclists.

Surrounding Uses

The Sausalito Yacht Club and its parking lot are located to the north of the existing Sausalito Ferry Terminal and Ferry Plaza. The City of Sausalito's Ferry Plaza encompasses the shoreline to the west of the terminal. The landscaped shoreline Ferry Plaza contains benches, tidal stairs, educational exhibits, ticket vending machines, ferry schedule signs, and newspaper racks. The Ferry Plaza and a concrete sidewalk extending to the north and the landside pier which extends approximately 95 feet into the water are within a Public Access Easement. A municipal parking lot is located west of the site and the Ferry Plaza. The lot is landscaped with non-native trees and ornamental shrubs. Adjacent to the parking lot is a Chamber of Commerce information kiosk, and the bicycle parking and ferry boarding reservation kiosk. The City of Sausalito's commercial district is located largely along Bridgeway, 300 feet west of the site, continuing to the southwest and northwest. The City of Sausalito's historic district is located to the south and west of the site. The San Francisco Bay Trail is located approximately 300 feet west of the project site and runs along Bridgeway. The closest commercial users are the Inn Above the Tide, Hotel Sausalito, and a row of shops

Golden Gate Bridge, Highway and Transportation District
Sausalito Ferry Terminal Improvements Project

and restaurants lining El Portal Street, currently a cul de sac serving the businesses and as a drop off for the ferry. To the east of the terminal boarding facility is open water, which is used for ferry operations and recreational activities. Existing conditions in the vicinity and adjacent to the project site are shown in Exhibits 5 and 6.

Project Purpose

Replace Aging Facilities to Keep Structurally Sound

The existing Sausalito Ferry Terminal boarding structures are aged and nearing the end of their useful life. The project purpose is to replace the aged structures with new structures designed to the current codes in order to continue providing public transit across the Bay.

Improve ADA Accessibility

The existing Sausalito Ferry Terminal gangways and gangplanks are steep and narrow. The District is proposing to construct the replacement boarding facilities in conformance with the draft Americans with Disability Act (ADA) guidelines for off-shore ferry passenger facilities in order to improve overall accessibility.

Improve Operational Efficiencies

At the existing Sausalito Ferry Terminal, passengers board and disembark through one door on the main (lower) deck of the ferry vessel, and at the existing San Francisco and Larkspur terminals passengers board and disembark through one door on the upper deck of the ferry vessel. Because these terminals board and disembark passengers on different decks, mobility-impaired passengers, passengers with bicycles or with strollers and wheelchair users must move between the decks to disembark. The existing Sausalito boarding facility limits the clear width of the door to 4 feet. The use of one door restricts passenger flow and increases the time for passengers to exit and to enter a vessel.

The District is retrofitting all of its ferry vessels to enable two door boarding and disembarking from the main deck. The width of these doors is eight feet. The proposed new boarding facilities will enable boarding and disembarking of all vessels from the same one level through two eight-foot wide doors.

Standardizing and upgrading the passenger boarding system will eliminate the need for the use of wheelchair lifts, which present their own set of potential problems, and require Ferry staff assistance to keep the lifts operational at all times given the circumstances of the marine environment causing vessel motions. The proposed improvements will eliminate the need to carry bikes and strollers from one deck to another and the resources and time impacts associated with these moves. For example, during the peak season, weekday highs at Sausalito reach up to 3,500 passengers per day and weekend highs reach up to 6,000 passengers per day. During peak days, 33% to 50% of riders have bicycles, which results in delays associated with loading and unloading of passengers where deck to deck transfers of the bikes are required. It currently takes approximately 30 minutes for passengers to disembark and board at Sausalito. It is estimated that the use of two eight-foot wide doors and the construction of the replacement facilities will decrease time of boarding and disembarking the vessel by three times (see Exhibits 7 and 8).

Golden Gate Bridge, Highway and Transportation District
Sausalito Ferry Terminal Improvements Project

Implementing standardized boarding and disembarking from the main deck will eliminate the need for passengers to transfer between the decks, which will improve ferry accessibility for all passengers, including those with disabilities, bicycles and strollers, and will encourage the use of non-motorized transportation options. Standardized boarding at all three Golden Gate Ferry Terminals will minimize confusion and increase comfort of boarding and disembarking for all riders.

Upgrade Emergency Preparedness

The proposed updates to the passenger boarding system are especially important for emergency preparedness to provide ferry sailings during times of emergency or during periods of other public mass transit service disruptions, when the ferries may be one of few transportation options for Bay Area residents. The proposed new boarding facilities are designed to work with other types of ferry vessels.

Proposed Project

New Boarding Facilities

The proposed Golden Gate Sausalito Ferry Terminal new boarding facilities will be located in approximately the same location as the existing facilities and are being proposed to consist of a new 150-foot long by 53-foot wide concrete float, a new 90-foot long by 19-foot wide steel gangway, and a new 96-foot long by 25-foot-wide pile-supported concrete access pier that will connect to the existing landside pier (see **Exhibit 9**). Two donut fenders will be installed at the aft/Bay end of the float to provide protection of the ferries and float. Vessels will be allowed to lay up on either side of the replacement float, just as they operate today with the existing float. The float design allows boarding of only one vessel at a time.

To provide power to the ferry terminal for lighting and electrical pumps, a new transformer is proposed to be installed inland approximately 280 feet west at the corner of Anchor Street near the entrance to the municipal parking lot. The existing ticket vending machines and signs will be relocated from their current location to a location in the southern area of the Ferry Plaza. (see **Exhibit 10 and 11**).

New walkway lighting will be installed on the new float, gangway and pier, and area lighting will be installed on the float. Navigation lighting will be installed on the floats and dolphins.

Temporary Construction Activities

Construction of the replacement facilities at the Golden Gate Sausalito Ferry Terminal will require the use of a temporary terminal in order to maintain ferry service across the Bay. This temporary terminal will be located immediately adjacent to and south of the existing terminal (see **Exhibit 9**). The gangway and float of the existing terminal will be used for the temporary terminal. Access to the gangway will be provided by a temporary 16-foot wide access pier. Passengers will have access to this temporary pier from the existing pier landward of the proposed demolition work needed for the new terminal. The temporary terminal will use the utilities currently available at the terminal. It is expected that the temporary terminal will be in place for approximately 14 months.

Replacement Facility Size

Using a moderate 4% escalation factor of ferry passenger growth per year (note that in the recent years the growth was 7% on average), the maximum demand in the peak summer season in year 2020 is projected to

Golden Gate Bridge, Highway and Transportation District
Sausalito Ferry Terminal Improvements Project

exceed 700 passengers per trip. The design of the replacement boarding facilities is based, however, not on the projected year 2020 maximum volume of passengers per trip but on the 85-percentile volume for that year (the 85-percentile means that from 100% of trips sorted in the order from the highest to the lowest volume, the passenger volume representing the 85% spot on the list is used for the design).

The Sausalito Ferry Terminal replacement facilities have been designed to comply with the ADA guidelines for off-shore ferry passenger facilities, to carry the projected 85-percentile volume of passengers in year 2020, and to meet the project purpose noted above. As a result, the size of the replacement facilities will be larger than the existing facilities. For example, the slope of the existing 70-foot long gangway reaches 1:9.5 (vertical: horizontal) at low tides. In order to provide for maximum 1:12 slope that comply with ADA guidelines during all tide conditions, the new gangway must be 90-feet long.

Similarly, the width of the existing float does not allow for gangplanks between the float and vessel to be of sufficient length to provide slopes which are do not exceed 1:12. The new float includes 18-foot long gangplanks between the float and vessels which will ensure that the slope does not exceed 1:12 during all tide conditions. The longer gangplanks result in the new float being wider than the existing float. The width of the new float is also driven by the boarding platform located at the center of the float. All District ferry vessels will be modified to include two eight-foot wide doors located on the main deck and positioned 48-feet apart. The 8-foot wide doors and gangplanks (the current width is controlled by 4-foot wide gangplanks) will allow for faster boarding and disembarking and the door locations will allow for standardizing the gangplank locations on the floats. The clear width of the gangplanks will match the door width in order to provide smooth flow of passengers. The gangplanks connect to the boarding platform, which dictates the platform width to be 16 feet in order to accommodate the passengers coming from the two 8-foot wide gangplanks. The two gangplanks and doorways will also allow for separating passengers with bicycles from those without bicycles, which will also improve the flow and speed of boarding and disembarking. The gangplank lengths coupled with the boarding platform width results in the width of the new float increasing from the existing width of 42 feet to the proposed width of 53 feet. The vessel door locations, the boarding platform length, the length necessary to transition from the boarding platform to the gangway (the boarding platform apron), the room necessary for emergency operations, plus the room needed to tie-up the different ferry vessel types all result in the new float requiring a length of 150 feet instead of the 110 feet length of the existing float.

In order to connect the new float and gangway to the landside pier, the project will construct a replacement access pier. The proposed replacement access pier is 96-feet long and 25-feet wide, with two 5-feet by 31-feet belvederes (or "bump-outs") on each side. Instead of replicating the dog-leg configuration of the existing access pier, the new replacement access pier will run on a straight line from the existing landside pier to the gangway. The location of the float and, therefore, the length of the access pier are controlled by the elevation of the bottom of the Bay. The float has been positioned as close to land as possible without it touching the bay bottom during low tides.

Public Access

The proposed project will increase public access to the Bay. The City's Ferry Plaza promenade is a public plaza with benches, educational exhibits, two tidal staircases to access the water, perimeter landscaped vegetation, and lighting with hanging floral baskets. The current public access within the Golden Gate

Golden Gate Bridge, Highway and Transportation District
Sausalito Ferry Terminal Improvements Project

Sausalito Ferry Terminal is limited to the 95-foot long and 20-foot wide landside pier. The pier has 6 benches in the center of the pier. A chain link gate restricts public access to the existing access pier because this pier is too narrow to allow for both public access and boarding and disembarking of vessels.

The new 96-foot long access pier will connect to the existing 95-foot long landside pier. The access gate will be moved to the end of the new pier, which will increase access onto the Bay for the public, whether for ferry passengers or those simply enjoying the views. The new access pier will have bump-outs on both sides providing space for 2 benches on each side. The bump-outs will provide a space for non-passengers outside of the spaces occupied by passengers queuing and by passengers boarding and disembarking.

The public access plan is shown in **Exhibit 12**. At night, the public access area will be illuminated with downward directed lighting, similar to that shown in **Exhibit 13**.

Discretionary Features

The District has designed the project to comply with design codes, regulatory agency requirements and the District's operational needs. The design includes some discretionary features, which the District is seeking input on from the City of Sausalito. The discretionary design features are color and configuration of the gangway truss, the access control gate and the pier railing. The width of the new access pier may also be considered as it may be decreased from 25 to 21 feet.

Configuration of the Gangway Truss

While the length and width of the gangway cannot be changed, the District proposes three different truss configurations for the City's consideration.

Exhibit 14 shows a truss with an arched top chord. The closed tubular steel truss members provide good protection from the environment, do not readily collect debris as girder designs will, and are consistent with marine facility design. The curved upper chord is located above eye level when walking on the gangway, to allow for better views, and the vertical and diagonal elements are spaced to allow an open look when viewed from the shore.

Exhibit 15 shows a similar steel truss design except that the top chord is lowered. This configuration reduces the profile of the truss, which partially obstructs views when walking on the gangway, but results in a smaller profile when viewed from the shore.

Exhibit 16 shows a standard rectangular steel truss. The overall height of this truss is smaller than the arched trusses, but the closer spacing of the truss members results in a more dense look when viewed from shore.

Configuration of the Access Control Gate

A gate is required to control access between the public access areas and the gangway and float. The District proposes three different gate configurations for the City's consideration.

Exhibit 17 shows a gate design with a curved roof located. The design includes two 8-foot wide roll-up gates and two 3-foot wide emergency exit doors on each side of the gates. The roll-up gates are operationally compact as they do not need space required for operating swing gates. The see-

Golden Gate Bridge, Highway and Transportation District
Sausalito Ferry Terminal Improvements Project

through metal grating of the doors allows for partial views when the gates are closed. The overhead roof of the gate provides for storage of the roll-up doors, light fixtures and security cameras required at the site. The side emergency doors are necessary in case there is a problem operating the roll-up gates.

Exhibit 18 shows an alternate gate design with two 8-foot wide swing doors. The doors must either swing in or out, which takes up more room when operating as compared with the roll-up gate. The use of swing doors eliminates the need for overhead structure to store the roll-up door but necessitates placement of lighting and security cameras on a pole extending above the gate. Three foot wide emergency doors are included on either side of the swing gates. It is possible to include these doors within the swing gates themselves, thereby reducing the overall width required for framing the doors.

Exhibit 19 shows a variation of the swing-door gate alternative with a curved top element, which visually ties into the gangway curve truss design and allows a place to mount lighting and cameras.

Configuration of the Pier Railing

The District's proposed railing design is also shown in previous **Exhibits 17 through 19**. This railing consists of vertical steel pipe pickets between rectangular support posts and a top. This design matches the existing railing at the Plaza and provides an open look. The District investigated alternate designs, including horizontal stainless steel cables, vertical stainless steel cables, and glass, which are shown on **Exhibits 20 through 23**. The District believes that the vertical steel pipe picket design fits best within the site, is the most durable and provides minimal visual impact when viewed from the shore.

Width of the New Access Pier

The District is proposing that the new access pier be 25 feet wide with two side belvederes and the gate located at the end of the new access pier near the gangway. This pier configuration and width provides sufficient space to allow for more efficient boarding and disembarking of the projected increased ferry ridership while allowing public access on the access pier at all times. While the reduced 21-foot width of the pier with two side belvederes can theoretically accommodate the projected volumes of passengers queuing and disembarking and the non-passenger presence on the pier, the flow of passengers will be subjected to more frequent disruptions because of lack of sufficient refuge space for persons that must suddenly stop or slow down. Reducing the width will only decrease the Bay fill by about 4%, and there is no significantly observable difference between the 25-foot and 21-foot wide piers when viewed from the shore.

Exhibits 24 through 41 present photo-simulations of the existing facility and proposed project from the south looking north, from the north looking south and from the parking lot near the Sausalito Yacht Club.

Exhibits 42 through 44 present photo-simulations of the gate location moved from the end of the access pier to the end of the existing landside pier. The District does not recommend locating the gates at this location since it will restrict public access to the landside pier only and will also result in a larger gate profile when viewed from the shore.

The District is proposing that the gangway truss, the access control gate and the pier railing be painted white as this is a traditional color used for marine type facilities. However, blue, grey or any other color(s) can be used as desired by the City (see **Exhibits 45 and 46**).

Golden Gate Bridge, Highway and Transportation District
Sausalito Ferry Terminal Improvements Project

The design of the replacement facilities has been minimized to the extent practicable, but the larger facilities are necessary in order to comply with ADA guidelines, improve operations improve passenger safety and public access. The existing and new structure descriptions, dimensions and over-water coverage are summarized in **Tables 1 and 2** below.

TABLE 1: NEW STRUCTURES AND FACILITIES

Structure	Dimensions
Float	The float is constructed of concrete and supports one end of the gangway, and framing above the float deck which provides access to the ferries. The float is 53 feet wide by 150 long and 12 feet deep. The float is held in position by steel pipe guide piles connected to the float by steel collars. Fenders to protect the ferries during berthing are placed on the sides of the float. The float has a total area of 8,385 sq. ft.
Donut Fenders	Two donut fenders are provided beyond the Bay end of the float to protect the ferries from impact with the float. These fenders consist of a rubber bumper that floats with the tide on a steel pipe pile. The donut fenders have a total area of 115 sq. ft.
Gangway framing	The gangway is a 'pony' truss--which means a truss on each side of the walkway--with no horizontal framing at the truss upper chord interconnecting the two trusses. The gangway has a total over-water length of 90 feet and a total width of 19 feet. Each truss is curved with a maximum height of 12 feet in the center and a minimum height of 8 feet on the ends. Total area of the gangway framing over water is 1,800 square feet.
Guardrail	The existing landside pier, new access pier, gangway, framing on the float, and hydraulic gangplanks have a guardrail along their perimeter. The guardrail is approximately 1,015 feet long, 3 inches wide and 3 feet, 6 inches in height. Total area of the guardrail is 3,550 square feet.
Hydraulic power unit	The hydraulic power unit is 11 feet long, 3 feet wide and 8.5 feet tall. Total area of the hydraulic power unit is 33 square feet.
Hydraulic system electrical control cabinet	The hydraulic system electrical control cabinet is 66 inches long, 18 inches deep and 72 inches tall. Total area is 8 square feet.
Gangplank control stations	Each of the four gangplanks has a gangplank control station structure. Each gangplank control structure is 6 inches in diameter and 8.5 feet in height supported on a 1-foot square base plate. Total area of all gangplank control structures is 4.0 square feet.
Gangplank control consoles	Each of the four gangplanks has a gangplank control console. Each gangplank control console is a box 1 foot 3 inches long by 12 inches wide, supported on a 3-inch square tubular post. Total area of all gangplank control structures is 5 square feet.
Platform lift cylinders	There are six platform lift cylinders. Each platform cylinder is 12 inches in diameter and varies in length from 12 feet to 16 feet depending on the boarding platform elevation. Total area of all platform cylinders, including the connection to the boarding platform is 38 square feet.
Access Pier	The new access pier is proposed to be 25 feet wide and approximately 96 feet long. It will be constructed of reinforced concrete. The pier will be supported on 24-inch diameter steel pipe piles. The total area of the pier is approximately 2,700 square feet (public + non-public). As noted above, the pier may be reduced to 21 feet wide for a total area of approximately 2,138 square feet.
Landside electrical equipment on concrete pad	A new transformer is required to provide power to the ferry terminal for lighting as well as the hydraulic pumps located on the float.

The over-water coverage resulting from a directly overhead view of the proposed Sausalito Ferry Terminal is further defined in **Table 2**, below. Areas calculated include the existing terminal, proposed terminal with 25-foot wide pier and 21-foot wide pier, and temporary terminal to maintain service during construction.

Golden Gate Bridge, Highway and Transportation District
Sausalito Ferry Terminal Improvements Project

**TABLE 2
OVER WATER COVERAGE AREA SUMMARY**

Terminal	Area (square feet)					Pile Types	Pile Area ³
	Landside Pier ¹	Access Pier	Gangway	Float ²	Total		
Existing	1,943	820	402	4,835	8,000	16 - 18" Square Concrete 12 - 12" Square Concrete 8 - 24" Dia. Steel Pipe	73 sf
Proposed 25-foot Wide Pier	1,943	2,700	1,800	8,500	14,943	12 - 18" Square Concrete 15 - 24" Dia. Steel Pipe 5 - 60" Dia. Steel Pipe 2 - 54" Dia. Steel Pipe	204 sf
Proposed 21-foot Wide Pier	1,943	2,138	1,800	8,500	14,381	12 - 18" Square Concrete 15 - 24" Dia. Steel Pipe 5 - 60" Dia. Steel Pipe 2 - 54" Dia. Steel Pipe	204 sf
Temporary ⁴	1,500	1,863	402	4,835	8,600	12 - 18" Square Concrete 18 - 12" Dia. Steel Pipe 8 - 24" Dia. Steel Pipe	66 sf

NOTES:

- ¹ Landside Pier is the existing pier from the landside to remain. A portion of this pier is landward of MHW (472 SF) and the other portion is waterside of MHW (1,471 SF) for a total of 1,943 SF. It does not include work on land immediately adjacent to and west of the pier for trenching to provide additional power to the terminal (250 SF).
- ² Float area includes the float structure, guide piles with surrounding collars, fenders outboard of the float, and donut fenders (at the new terminal only).
- ³ Pile Area is already included in the areas shown in 'Terminal Area'. It is repeated here for information only. The pile areas shown include the piles supporting the existing 'Landside Pier' to remain. The Landside Pier is supported on 12 - 18" square concrete piles (21 sq. ft.)
- ⁴ The Landside Pier area is reduced from the existing area to account for construction work at the east end of the pier.

Design Criteria

The gangway and ramp slopes and other accessibility features were designed using the U.S. Access Board "Proposed Accessibility Guidelines for Passenger Vessels," and the Port of San Francisco "Access Design of Floating Structures." The gangway was designed in accordance with the American Association of State Highway Officials (AASHTO) Bridge Design Specifications. A coastal analysis was completed to define the environmental characteristics (wind, wave, current) at the site which were then used to design the float and guide piles. The access pier was design using the 2013 California Building Code (CBC). All work done satisfies the CBC.

Golden Gate Bridge, Highway and Transportation District
Sausalito Ferry Terminal Improvements Project

Approval Status

Environmental Review

CEQA: As lead agency under the California Environmental Quality Act (CEQA), the Golden Gate Bridge, Highway and Transportation District prepared an Initial Study and Mitigated Negative Declaration (IS/MND) for the proposed project. The District found that the project will not result in significant effects to the environment, with incorporated mitigation measures adopted as conditions of approval. The District filed the Notice of Determination with the Marin County Clerk on December 18, 2012.

NEPA: The project was found to qualify for a categorical exclusion under 23 CFR Section 771.118(d)(6) "Facility modernization through construction or replacement of existing components." The District prepared a documented Categorical Exclusion (CE(d)) and found that the project will not induce significant environmental impacts. The U.S Department of Transportation Federal Transit Administration (FTA), as lead agency under the National Environmental Policy Act, concurred with these findings on February 13, 2014.

Resource Agency Consultations

USFWS: In July 2012, FTA submitted a request for concurrence from the U.S. Fish and Wildlife Service (USFWS) under Section 7 of the Endangered Species Act (ESA) that the project will have "no effect" on the California least tern and the southern sea otter, and that the project "may affect, but is not likely to adversely affect" delta smelt. In November 2012, USFWS did not object to the FTA's determination that the project will have "no effect" to the southern sea otter, and concurred that the project will have no effect on the California least tern and that delta smelt will not be adversely affected by the project. In August 2014, the USFWS provided additional clarification that they also concur the project will have no effect on the southern sea otter.

NMFS: Similarly, the FTA submitted a request for concurrence from the National Marine Fisheries Service (NMFS) under the ESA that the project "may affect, but is not likely to adversely affect" the following ESA-listed fish species: green sturgeon, steelhead (Central California Coast DPS), steelhead (California Central Valley DPS), Chinook salmon (Sacramento River winter-run ESU), Chinook salmon (Central Valley spring-run ESU), as well as the humpback whale, and ESA-designated critical habitat. The FTA also requested concurrence under the Magnuson-Stevens Fishery Conservation and Management Act that the project "may affect, but is not likely to adversely affect" essential fish habitat (EFH) including eelgrass beds, in the form of minimal short-term (construction-related) impacts. Lastly, the FTA concluded the project will have "no effect" on Pacific harbor seal, California sea lion, and harbor porpoise under the Marine Mammal Protection Act (MMPA).

Over the course of approximately 10 months following the consultation request, NMFS and the FTA corresponded about project design details, and the FTA provided additional information and clarification (including additional avoidance and minimization measures) as requested by NMFS, to support its review of the consultation request. In November 2013, NMFS concurred with the FTA's determination that, with the District's incorporation of the proposed avoidance, minimization, and mitigation measures, the proposed project is not likely to adversely affect ESA-listed fish species and designated critical habitat.

Golden Gate Bridge, Highway and Transportation District
Sausalito Ferry Terminal Improvements Project

With respect to EFH for various fish species and including eelgrass beds, NMFS determined that, while the project could adversely affect EFH and eelgrass beds due to temporary construction-related impacts, as well as due to the project's permanent increase in over-water shading, the project does include measures to avoid, minimize, and otherwise offset these adverse effects to EFH. These measures include the project's proposed compensatory mitigation for permanent overwater shading impacts, which includes incorporating the use of light-penetrable materials and a structural orientation to minimize shading effects, as well as contributing funds towards on-site in-kind mitigation efforts focused on eelgrass habitat creation and restoration, to be undertaken by the State Coastal Conservancy. Based on the above project measures to avoid, minimize, and otherwise offset adverse effects to EFH, NMFS had no additional EFH conservation measures to request or provide. Lastly, with respect to the MMPA, NMFS confirmed that there are no major haul-outs or rookeries in the project vicinity, that the ESA-listed humpback whale and Steller sea lion are not expected to occur in the project area, and NMFS determined that the implementation of the proposed avoidance measures for marine mammals (such as the establishment of a 500-meter safety zone for pile driving activities, with a biological monitor empowered to cease work if a marine mammal is observed within the zone), are expected to avoid the take of all non-ESA listed marine mammals.

CDFW: The District requested a consistency determination from the California Department of Fish and Wildlife (CDFW; formerly CDFG) between the federal consultation process under Section 7(a)(2) of the Endangered Species Act (ESA) and Section 2080.1 of Fish and Game Code, for species that are both State and federal-listed. The co-listed species include California least tern, southern sea otter, delta smelt, Chinook salmon (winter-run Sacramento ESU), Chinook salmon (central valley spring-run ESU), humpback whale, and essential fish habitat (EFH) including eelgrass beds. Additionally, the District requested that CDFW concur that the project will have no adverse effect on longfin smelt, which is only listed at the state level. In February 2013, CDFW responded with specific recommendations for the project to reduce environmental effects. The District responded indicating how the recommendations will be addressed. In April 2013, CDFW indicated appreciation for the District's responses and noted that CDFW does not issue concurrence for "no adverse effect" determinations.

SHPO: Pursuant to Section 106 of the National Historic Preservation Act, FTA consulted with the California State Historic Preservation Office (SHPO) in July 2012. FTA requested that SHPO concur with the Area of Potential Effects and a determination of "No Historic Properties Affected." SHPO issued a concurrence with this determination in September 2012.

Permitting

USACE: The District submitted an application which included a Preconstruction Notification (PCN) for a Section 10 Rivers and Harbors Act permit from the U.S. Army Corps of Engineers (USACE) in October 2013. In December 2013, USACE indicated it will consider issuance of a Letter of Permission, upon issuance of a Coastal Zone Management Act (CZMA) Consistency Determination from BCDC and a 401 Water Quality Certification from the San Francisco Bay Regional Water Quality Control Board (RWQCB).

RWQCB: The District submitted an application for 401 Water Quality Certification to the RWQCB in October 2013. In November 2013, the RWQCB indicated that, to complete the application, the District must provide a mitigation proposal for the increased over-water coverage of the project. Based on FTA

Golden Gate Bridge, Highway and Transportation District
Sausalito Ferry Terminal Improvements Project

coordination with NMFS as described above, the District developed and submitted to the RWQCB a proposal for compensatory mitigation that consists of the contribution of funds towards on-site in-kind mitigation efforts focused on eelgrass habitat creation and restoration, to be undertaken by the State Coastal Conservancy. The District has entered into a Cooperative Agreement with the State Coastal Conservancy to fund these activities. On September 12, 2014, the RWQCB concurred with the mitigation proposal and provided the 401 certification.

BCDC: In April 2013, the District had an early coordination meeting with BCDC regarding the project and the permit application process. The District submitted an application to BCDC for an amendment to Permit No. M94-70 in January 2014. In February 2014, BCDC responded with comments and requests for clarification on the application. The District provided responses to these comments to BCDC in May 2014, and the two agencies met for a site visit in July 2014. The BCDC informed the District that a presentation to the BCDC Design Review Board (DRB) would be required. The District presented the project to the DRB in October 2014. Subsequent to the October 2014 DRB meeting, the District presented to the BCDC Commission for a public meeting in December 2014. The BCDC requested additional information from the District prior to the Commission voting on the permit. The District is working with BCDC to schedule this meeting.

City of Sausalito: The District made several presentations to the City Council between 2010 and 2012. The District briefed the City Council on the project in December 2014. In February 2015, the City Council requested and the District agreed to present the project at a number of public meetings between February and April 2015, after which the Council will decide whether to provide its concurrence with the project. The District has executed a Right of Entry (ROE) permit with the City of Sausalito for the construction of the temporary ferry terminal. The ROE permit will be provided for the construction of the temporary facilities and one piling that is slightly outside the existing lease area. It provides for the temporary facility to be removed once the permanent facilities are constructed and opened for use.

Sausalito Plus
Update on Crowd Management Challenges Related to Tourist Bikes and the Ferry Queue

1. Crowd Management Days
 - a. Late March – Mid-April: School break weeks/weekends
 - b. July & August: Friday-Monday, July 4th
 - c. September: Saturday & Sunday, Labor Day
 - d. October: a few scattered weekend days
2. Tourist Bike Numbers – on Crowd Management Days
 - a. 1,700 – 3,500 (as counted from 11-4; numbers can be higher every day)
3. Bike Arrivals
 - a. Early arrivers begin showing up at 11:00 am
 - b. Largest number of bikes arrive in downtown Sausalito between 1 & 4
4. Queuing Issues
 - a. Insufficient help handling queuing
 - b. Early arrivers often take ferries back to San Francisco beginning at 1:00 PM
 - c. The vast array of bikes (90%) begin gathering in the queuing area at ~ 2:00 - 2:30
 - d. Lines going down the sidewalk adjacent to Tracy Way and down Anchor Street begin forming at ~2:00-3:00 PM, continuing often until 6:00 PM
 - e. At this point, there are a vast array of bikes in and around the center of El Portal as well
 - f. Many bikes interfere with Inn Above Tide access in and out
5. Implications (Safety Issues That Occur)
 - a. Loss of the sidewalk adjacent to Tracy Way
 - i. Leads to:
 1. Walking in Anchor Street rather than the sidewalk
 2. Walking through the car parking area
 - b. Loss of access through the ADA area adjacent to Tracy Way (north and south)
 - i. Disables access – especially for those handicapped, but for all
 - c. Inability for car parkers to access kiosks to pay
 - i. Limits kiosk availability - very frustrating
 - d. Tourist bikers in lines for long times – sometimes 1.5 – 2 hours – many with children
 - e. Pedestrians forced to walk “IN” Anchor Street – as the adjacent sidewalk is usually full of bikes
 - f. Forcing pedestrians coming off a ferry to walk through the Lot 1 car parking area
 - g. Bikes going through Lot 1 on a regular basis – to get to the ferry ticket area or go around Lot 1 to get free parking

SAUSALITO POLICE DEPARTMENT

John Rohrbacher
Chief of Police

Date: September 25, 2017
To: Adam Politzer, City Manager
From: John Rohrbacher, Chief of Police
Subject: Discussion Items Related to Congestion Management at the Ferry Landing

Historically the Ferry Division of the Golden Gate Bridge Highway & Transportation District has been a very active participant as a partner in the Sausalito Police Department's efforts at congestion management and safety in the downtown area and the ferry landing. Under the leadership of Ferry Division Deputy General Manager Jim Swindler, they have been consistently using the lessons learned from previous years to make improvements going forward. Most notably of these is the addition of a crew member on each vessel to assist with the loading and unloading of passengers with bicycles, the addition of a second vessel to service the Sausalito run, and taking tickets from passengers before they reach the vessel doors.

However, there are still a few issues that require attention toward a longer term solution. It is my opinion that queue management, a better reservation system, and the location of the District's ticket machine are the most important. The problems associated with these were present three years ago, remain present now, and are foreseeably going to be problems in the future unless some changes are made going forward and more so during construction of a new float and ferry landing.

The District's ticket vending machine is in the worst possible location as it is right next to the path of travel for vehicles circulating to the exit of Municipal Lot #1. As people line up to purchase a ferry ticket, the line spills into the parking lot and blocks traffic, increases congestion, and places pedestrians in danger. This dangerous situation manifests itself primarily during the months of April through October which is our busiest season for visitors. The ticket machine location is much less of a problem during the remaining months as the ferry passengers are generally regular commuters that do not require the daily use of the ticket machine. To assist the District with solving this seasonal problem, we offered to co-locate a separate ticket vending machine alongside the seasonal ticket vending machines we install for the payment of bicycle parking. We also offered the use of our multi-space ticket machines located in several places in Municipal Lot #1. To date, the District has not taken advantage of either offer. Going forward, both offers still stand.

The issues of queue management and a working reservation system could, and should, be considered jointly. With the goal of better queue management, the District has experimented with several different reservations systems over that last few years. It stands to reason that if an effective and properly managed reservation system were in place, far less ferry passengers with bicycles would need to be in line to board a ferry for the trip back to San Francisco. From my observation, the reservation system from two years ago using boarding numbers issued in groups of 100 seemed to work the best. This year, the District implemented an online ticket purchase option and an online reservation option that was clearly explained in their Summer 2017 *How To Take A Bike On The Ferry* tri-fold brochure for this season. I do not know how

SAUSALITO POLICE DEPARTMENT

John Rohrbacher
Chief of Police

many passengers with bicycles used this online reservation system but from seeing the long passenger queue, it seems not enough to make a difference to reduce the line to board a ferry. The District is once again working in partnership with the Sausalito Chamber of Commerce this year to assist with congestion management related to ferry passengers with bicycles. The online reservation system was included in the Chamber's 2017-2018 Sausalito Visitor Map. With savvy visitors that are comfortable with using their phones for this type of technology, it should have worked better.

Regardless of which reservation system the District puts in place, the supervision of the queue workers is vital to its success. This year, for the first time, it was observed and reported that there was little or no supervision of the few workers on duty and, as a result, the workers were not doing their job but instead were chatting with friends or glued to their phones. If it is accurate to say that the District's union workers are not permitted to supervise non-union workers, then that must be addressed likely with the addition of a non-union supervisor. There were also days with no workers at all. A far more robust work crew is required for a queuing management effort.

I foresee these issues will be significant during the construction phase of the new ferry landing and I expect and hope that the District will make focus on making the changes needed to improve safety and congestion management during this critical and potentially dangerous 18 month period. Improvements that are successful during this time could then be used going forward with a goal of not having to keep trying something new each year.

EXHIBIT 8

Additional Information per City of Sausalito 7-22-16 Request

On July 22, 2016, the City of Sausalito, via email from Adam Politzer, requested the District provide information on four additional items related to the District's design. The requested information and the District's response to each is as follows:

1. *Please provide to COWI and the City the calculated delay impacts from a more narrow pathway if the gangway and/or boarding platform was reduced from 16' to 14' and from 16' to 12'.*

A: The District has previously provided information substantiating the 16 foot clear width for the gangway and boarding platform. Refer to the following information that the District submitted to the City for the City's peer reviewer:

- May 16, 2016 float discussion submittal
- June 8, 2016 email answering peer reviewer's questions
- June 16, 2016 submittal answering reviewer's questions
- June 30, 2016 submittal answering peer reviewer's questions
- July 15, 2016 email answering peer reviewer's questions

The District has consistently stated that a 16 foot clear width is the minimum width required for the District to address its operational needs. The District's ferry vessels are being modified to accommodate boarding and unloading from two 8 foot doors. Two 8 foot wide gangplanks will span between the vessels and the boarding platform, necessitating the boarding platform to be 16 feet wide. Reducing the boarding platform and gangway widths to less than 16 feet will cause passenger flow congestion which in turn will increase the ferry turnaround time and result in passengers being left behind as they are today in order to maintain the ferry schedule. The existing facility has varying passenger walkway widths which cause congestion and slowdowns as passengers navigate through the facility. The District's design is intended to eliminate these operational inefficiencies.

The District notes that compared to other recently completed and proposed ferry terminals on the San Francisco Bay which use vessels with smaller passenger capacities, the 16 foot gangway width for the Sausalito Ferry Terminal Improvements project is reasonable.

Ferry Terminal Location	Lead Agency	Status	Gangway Width	Maximum Ferry Capacity
Sausalito	GGBHTD	CEQA complete – Filed NOD in 2012	16 feet	750 passengers
San Francisco - Ferry Building	WETA	CEQA complete – Filed NOD in 2014	10 feet 1 inch	395 passengers ¹
South San Francisco	WETA	Construction complete in 2012	10 feet 1 inch	199 passengers ²

¹ 395 passengers is the largest passenger capacity ferry vessel in the San Francisco Bay Ferry fleet (operated by WETA). Two ferry vessels with an expected 400 passenger capacity are under construction now and are projected to be completed by late 2016.

² The maximum ferry vessel capacity currently operating out of South San Francisco ferry terminal

The District has performed an analysis as requested by the City, and the calculated delays associated with increased ferry turnaround times due to reducing the gangway and boarding platform clear width are listed in the table below. As shown, reducing the width results in an increased turnaround time of up to nearly 5 minutes.

Minimum Passenger Clear Width	Project Goal Turnaround Times		Calculated Typical Turnaround Times		Difference Between Project Goals and Calculated Turnaround Times ¹	
	Target	Max	Typ. Min	Typ. Max	Typ. Min ²	Typ. Max ³
16 feet	10 min	15 min	12.6 min	14.6 min	+ 2.6 min	- 0.4 min
14 feet	10 min	15 min	13.5 min	15.5 min	+ 3.5 min	+ 0.5 min
12 feet	10 min	15 min	14.6 min	16.6 min	+ 4.6 min	+ 1.6 min

¹ A positive value indicates there will be a delay in turnaround times due to calculated time greater than project goals

² Calculated typical minimum turnaround time – Project target goal turnaround time

³ Calculated typical maximum turnaround time – Project maximum goal turnaround time

Note that these times assume ideal ferry operational conditions and do not account for slowdowns caused by intentional varying walkway widths (i.e. bottlenecks/choke points). The calculations and assumptions are provided in Attachment A. Recall that the District's previous information to the City's peer reviewer stated that the turnaround time calculations were based on aggressive, ideal situations that do not account for ferry docking delays due to poor weather conditions, passengers not queued and ready to disembark upon ferry landing, safety hazards encountered during the security sweep that require immediate attention, boarding passengers that are not familiar with the boarding procedure, and passengers with limited mobility.

Also, recall that the design of the replacement boarding facilities is based on the projected year 2029 maximum volume of passengers per trip using the 85-percentile volume (the 85-percentile means that from 100% of trips sorted in the order from the highest to the lowest volume, the passenger volume representing the 85% spot on the list is used for the design). This means that 15% of the time, the number of passengers will be greater than those used in the calculations.

As previously stated, the District will not build a defective ferry terminal that does not address the District's operational needs. The District's mission is to encourage ferry ridership to reduce traffic along the 101 corridor. To encourage the use of public transportation, the ferries must provide a reliable, safe, and cost effective alternative to driving.

2. *In order to complete our due diligence on this project the City needs to get the District's passenger counts from 2014, 2015 and 2016 (year to date). Please include the breakdown for bikes and pedestrians per trip for both inbound and outbound passengers.*

A: The District previously submitted March 2014 – March 2015 data to the City in April 2015 in response to requests made during the joint Planning Commission and Historic Landmarks Board April 1, 2015 meeting. For completeness, the passenger counts from January 1, 2014 to July 9, 2016 per ferry trip are attached in Attachment B.

Please note that the District provided additional ferry trips that were not scheduled in order to alleviate some of the crowds at the Sausalito Ferry Landing. These extra trips (denoted with an "E" under the "Source" data column in Attachment B) are significant additional operational costs for the District and cannot be sustained. As stated in previous submittals to the City, the District does not profit from ferry services as they are subsidized with bridge tolls and other revenue means to reduce traffic congestion on the Golden Gate Bridge and reduce vehicle use. Currently, disembarking and boarding at the existing facility is slow, due to a narrow passage way and single door access to the vessel. In order to stay on schedule, boarding must cease at a specified time, often leaving passengers behind while a less-than-full vessel departs. The proposed ferry terminal replacement will allow for full utilization of the ferry vessel capacity due to faster disembarking and boarding of passengers, therefore generally eliminating the need for extra ferry trips.

EXHIBIT 9

Responses to Questions from the City of Sausalito Received June 9, 2016

This serves to respond to the questions sent June 9, 2016 by the City of Sausalito to the District. The questions and answers are intended to facilitate in City of Sausalito's Peer Review of the proposed float dimensions.

1. *Q: The 16.0' clear width of the gangway, fixed landing, boarding apron and boarding platform is based on the ferries having two 8.0' wide doors being used simultaneously (Ref. A: page 3 of 7 second paragraph, Float-Dimension Discussion-Width). Also the 16' central walkway was sized "to accommodate passenger flow from each of the two ferry doors (coming out of the ferry, going into the ferry) being used simultaneously (operational consideration)" (Ref. C: page 5 of 14 first paragraph, Float Width). Please provide quantitative information to support the conclusion that the 16.0' width is needed to accommodate the desired boarding operations. For reference, minimum clear widths for some of the subject elements are: 36" gangway (Ref. B chapter V410.5), 36" fixed landing (Ref. B chapter V410.7.2) and 36" Boarding Apron (Ref. B chapter V405.5).*

A: The proposed width of the gangway is not driven by ADA access concerns, but by operational needs. Currently, disembarking and boarding at the existing facility is slow, due to a narrow passage way and single door access to the vessel. In order to stay on schedule, boarding must cease at a specified time, often leaving passengers behind while a less-than-full vessel departs. The new facility is designed to increase speed of disembarking and boarding to achieve full utilization of the vessel capacity.

To determine the appropriate width of the gangway and boarding ramps, the District estimated the volume of passenger growth through year 2029. Using a moderate 4% escalation factor of ferry passenger growth per year (note that in the recent years the growth was 7% on average), the maximum demand in the peak summer season in year 2029 is projected to exceed 700 passengers per trip. However, the design of the replacement boarding facilities is on the projected year 2029 maximum volume of passengers per trip using the 85-percentile volume (the 85-percentile means that from 100% of trips sorted in the order from the highest to the lowest volume, the passenger volume representing the 85% spot on the list is used for the design). Based on this, the ferry passenger count used for the design of the proposed facility is:

- 408 total passengers disembark from ferry vessel onto facility
- 512 total passengers board from facility onto ferry vessel (200 out of the 512 total passengers board with bicycles)

Based on these estimates, designers used "Pedestrian Planning and Design", revised edition, by John J. Fruin, to verify that the proposed facility is able to meet the projected passenger counts, within the current ferry schedule and without leaving queued passengers behind. This document is considered to be standard for ferry facility design. This document presents different level-of-service (LOS) descriptions for walkways and queuing areas. The LOS ranges from A (pedestrians freely chose their own walking speed and have no space restrictions) to F (close and unavoidable contact with others causing physical and psychological discomfort). The information provided for each LOS does not account for passengers with bicycles, so assumptions were made based on observations to determine the applicable LOS criteria for passengers with bicycles. The following LOS requirements for the proposed design were chosen to be consistent with the currently observed conditions at the existing facility:

- Passengers walking while disembarking: LOS D/E = 10 sf/pax , 20 pfm
 - Passengers walking while boarding: LOS E = 8 sf/pax , 23 pfm
 - Passengers walking with bicycles while boarding: LOS E = 36 sf / pax (4' x 9') , 12 pfm
 - Passengers while queuing (waiting in line): LOS C/D = 7 sf/pax
 - Passengers with bicycle while queuing (waiting in line): LOS C/D = 32 sf/pax (4' x 8')
- Note: sf = square feet; pax = passenger; pfm = passengers per foot width per minute

Applying the LOS requirements, it was determined that a 16' wide clear path for passengers is the minimum width required to keep the current ferry schedule with the projected passenger counts. This also helps with passenger flow from the two 8' wide ferry doors by not introducing intentional choke points on the float design.

In addition to disembarking and boarding of passengers, the following is taken into consideration when verifying the replacement facility will maintain the current ferry schedule: securing the vessel to the dock, verifying that the doors are securely positioned to be opened, opening the doors, verifying that all passengers are off the vessel and conducting a security sweep of the vessel, and, after the boarding, closing the doors, and tying off the vessel.

The current ferry schedules for the Sausalito Ferry and the District's ferry vessel passenger capacities are found in the document titled "Proposed Float Size Discussion – For City of Sausalito Peer Review" sent to the City of Sausalito from the District in a May 16, 2016 email. As noted in this document, the Spaulding class vessels are the most frequently used vessel by the District at the Sausalito Ferry Landing.

The District does not have the resources to increase the number of trips to and from Sausalito during the peak weekday commute times. When the demand is high in Sausalito on weekends, the District runs additional trips when possible. As described above, the narrowness of the existing facility impedes the use of the ferry vessels at their capacity. The replacement facility will enable this currently unused capacity to be utilized without adding trips.

2. *11.0' feet is provided under the float end of the gangway for: the gangway support frame, maintenance access and the guide pile collars (Ref. A: page 3 of 7 last paragraph, Figure 5, Drawing S1.2). Please clarify if this distance can be optimized.*

A: This distance has been re-evaluated and optimized to the extent possible. There must be space on the float around the gangway support for safe maintenance access (5.5'). This distance remains 11'.

3. *The fixed landing is 10.0' long (Ref. A: page 3 of 7 last paragraph, Figure 5) whereas the minimum length is 5.0' (Ref. B chapter V410.7.3). Please provide sketches and/or calculations showing that the combination of the tides and transition plates require the fixed landing to be 10' long.*

A: Please see Attachment 1 for the plan view of the proposed transition plates on the fixed landing. The walking surface of the fixed landing is 8'-8". The gangway transition plate at low water is approximately 2'-3" beyond the fixed landing. The Boarding Apron transition plate is approximately 1'-1" beyond the fixed landing. This results in 3'-4" of required length on the fixed landing. 3'-4" of transition plate length + 5'-4" fixed landing length = 8'-8". The overall dimension of the fixed landing (outside to outside distance of the base plate of the column-deck connection) is approximately 10'.

4. *The boarding platform is 79.5' long (Ref. A: page 4 of 7 last paragraph, Figure 6, Drawing S1.2, Float-Dimensions Discussion-Length) whereas the outside-to-outside distance of the vessel doors is 56.0'. Please clarify if the boarding platform length can be optimized.*

A: This distance has been re-evaluated and optimized to the extent possible. The center to center spacing between ferry doors is 48' and the clear width door opening is 8' per door, therefore the distance between the clear door opening of both doors is 56'. The remaining 23.5' of the boarding platform length accounts for the sliding gates for the gangplanks, hydraulic lift cylinders, and an employee-only access ramp required to access the aft end of the float for maintenance. Please see page 6, Figure 6 on page 7, Figure 8 on page 8, Figure 9 on page 9 and page 12 of the "Proposed Float Size Discussion – For City of Sausalito Peer Review" document dated 5-16-16 for more information.

5. *15.0' is provided at the end of the float for the guide pile collars, utility boxes and a 6.0' access path (Ref. A: page 5 of 7 first paragraph, Figure 7, Drawing S1.2). Please clarify if this length can be optimized.*

A: This distance has been re-evaluated and optimized to the extent possible. This distance remains 15'.

**Subject: Alcatraz Embarkation Facility – Pier 31 ½ Transportation Circulation Study
Response to PMND Appeal Transportation Concerns**

Dear Julie:

We understand the Preliminary Mitigated Negative Declaration (PMND) on the above subject project has been appealed by the City of Sausalito. As noted in the PMND, the project would include ferry service from Pier 31 ½ to Fort Baker including up to two round trips on weekends only. The City of Sausalito's appeal, prepared by Sheppard Mullin, and dated December 27, 2017, claims that the Fort Baker ferry service component of the project may substantially increase visitor demand to Sausalito, exacerbating already-congested conditions along Sausalito's waterfront, which could potentially cause significant environmental impacts that were not evaluated in the PMND. Further, the City of Sausalito's appeal states that the PMND should have included more detailed discussion about the environmental setting further from Fort Baker, including the Marin Headlands, Alexander Avenue, and Sausalito.

This letter provides additional discussion of the environmental setting near Sausalito and additional discussion of travel demand specific to Sausalito that may be included in the PMND for informational purposes. This letter also includes a more specific response to the transportation-related concerns identified in the City of Sausalito's letter, based on the additional setting and travel demand analysis contained herein.

ADDITIONAL SETTING DISCUSSION

The PMND prepared for the Alcatraz Embarkation Facility did not forecast substantial amount of additional transportation demand between Fort Baker and Sausalito associated with the project. However, additional detail on the existing setting along Alexander Avenue and within Sausalito is provided here for informational purposes.

The City of Sausalito currently experiences high tourism on weekends, particularly during the summer months. On-street traffic and bicycle and pedestrian flows along the City's waterfront are

routine, including perceived high levels of congestion. The Golden Gate Bridge, Highway, and Transportation District (GGBHTD) and the Blue and Gold Fleet operate several ferries between Sausalito and San Francisco on weekends, with higher frequency during the peak summer periods. As part of a separate project, the GGBHTD plans to increase the size of the ferry terminal in Sausalito to accommodate increases in ferry ridership. According to the *Second Addendum to the 2012 Initial Study/Mitigated Negative Declaration and 2017 Addendum for the Sausalito Ferry Terminal* (LSA Associates, 2017) (Ferry Terminal Addendum), the number of ferry passengers with bicycles can reach up to 6,000 passengers per day on peak weekends, which contributes to the congestion in Sausalito and creates some operational challenges associated with loading/unloading passengers.

Specifically, the Ferry Terminal Addendum notes that the primary areas where congestion occurs are in the parking lot areas adjacent to the ferry terminal, with concentrations near the pier, the sidewalks connecting the pier to the local street network, and near the ferry ticket kiosk associated with ferry passengers with bicycles attempting to board ferries to return to San Francisco. The City of Sausalito has noted that this congestion creates safety concerns.

To manage the congestion, the City of Sausalito has adopted a number of strategies including physical improvements to better manage the demand and increased enforcement. The Ferry Terminal Addendum found that with active management to prevent queues from extending outside a designated queuing area, the proposed expansion project would have less than significant transportation impacts.

Fehr & Peers examined collision statistics for an approximately one quarter-mile long segment along Bridgeway, from Bay Street to a midblock location to the south, approximately at Scoma's restaurant for the most recent five-year period for which data is available, 2012-2016 (see Figure 1).¹ This area includes the area that experiences the highest levels of tourism-related congestion.

During that five-year period, a total of 17 collisions were reported. Three of the collisions were reported during weekends and five were reported on Fridays, with the remaining nine occurring on Mondays through Thursdays. Fourteen of the seventeen collisions involved bicycles or pedestrians (eight with bicycles and six with pedestrians). Five of the 17 collisions were reported during the

¹ California Statewide Integrated Traffic Records System (SWITRS), most recently accessed February 2, 2018. Note that records from 2015 and 2016 are considered provisional and subject to change.

month of June, with no other month experiencing more than two (January, September, and October each recorded two collisions). Overall, the data suggests that weekends do not appear to experience disproportionately high rates of collisions. However, the vast majority of reported collisions did involve bicycles or pedestrians. Detailed collision data are provided in the Appendix to this letter.

Figure 1 - Reported Collisions along Bridgeway in Sausalito (2012-2016)

In April 2017, Fehr & Peers completed a study for the Golden Gate National Recreation Area (GGNRA) of conditions at and around Vista Point at the Golden Gate Bridge, which included counts of traffic volumes and speeds along Alexander Avenue on summer weekends in 2016. Alexander Avenue, particularly north of Bunker Road, is the primary route to access Sausalito by car from San Francisco and points to the south, and thus, represents a reasonable proxy for tourist vehicle traffic to and from Sausalito. That study found that the peak traffic volume on Alexander Avenue, north of Bunker Road, near the Fort Baker site, was approximately 775 vehicles per hour on both Saturday and Sunday on a May weekend (May 14-15, 2016). During this same weekend, the 85th percentile

travel speed along the same portion of Alexander Avenue was approximately 40 mph. Traffic counts and speed survey data are included as an Appendix to this letter.

SUPPLEMENTAL ANALYSIS OF TRAVEL DEMAND TO SAUSALITO

As noted in Table 4 of the PMND, the Fort Baker ferry service component of the project would serve approximately 40,000 visitors annually, with service operating on weekends only via two round-trips per weekend day. Visitation is expected to vary by season, with summer and holiday weekends experiencing higher usage than the off-peak winter season. During typical off-peak days, the service is expected to serve approximately 250 visitors per weekend day. During peak weekends, visitor forecasts are expected to reach 500 passengers per day, or approximately 250 passengers per boat.

As noted in the Setting section, both the GGBHTD and the Blue and Gold Fleet operate several ferries between Sausalito and San Francisco on weekends, with higher frequency during the peak summer periods. Combined, the ferries operate approximately 12 round trips per day on peak summer weekends, with service between Sausalito and the San Francisco Ferry Terminal and Pier 41. Because the ferry service between Sausalito and San Francisco is so robust, it is unlikely that most visitors would choose to take a ferry to Fort Baker and then some other form of transportation to Sausalito, as it would be a more circuitous, time-consuming, and likely more expensive way to travel.² Instead the ferry service to Fort Baker would likely be most attractive to visitors who wish to visit Fort Baker's many uses, including the Cavallo Point Lodge (restaurant, spa, hotel, and conference center), the Bay Area Discovery Museum, Battery Yates and Battery Cavallo, the Travis Sailing Center/Presidio Yacht Club, or the California Coastal Trail in the Marin Headlands.

However, even if some users did elect to make the trip to Sausalito via Fort Baker, options for doing so are limited. Walking is not likely a viable option. The distance between Fort Baker and Sausalito is approximately 2 miles, and sidewalks or paths between the two are discontinuous. Pedestrians

² It is also unlikely that most visitors would take a ferry to downtown Sausalito from San Francisco and then travel to and from Fort Baker from downtown Sausalito because the distance between the San Francisco Ferry Building and Pier 31.5 is approximately one mile and the numerous travel options that exist between those two sites. In other words, it is most likely that if a visitor is destined for downtown Sausalito, they would leave from the San Francisco Ferry Building and if a visitor is destined for Fort Baker, they would leave from Pier 31.5.

would likely be forced to use Alexander Avenue or East Road, both of which are very narrow, windy, and steep with partial sidewalks, and would be extremely uncomfortable for pedestrians. Bicycling is also not a likely option, as bicycles would be prohibited on the Fort Baker ferries, and there are not currently any bicycle rental locations in Fort Baker, nor are there any known plans to add them. Thus passengers would not be able to obtain a bicycle in Fort Baker with which to ride to Sausalito. Finally, transit service between Fort Baker and Sausalito is virtually non-existent, and there are no shuttles currently or planned in the future. The most viable potential way for visitors to travel between Fort Baker and Sausalito would be by Transportation Network Company (TNC), such as Uber or Lyft, or other types of for-hire vehicles (e.g., taxis).

While traveling to Sausalito via Fort Baker does not appear to be a particularly convenient or desirable route, even if it were to occur, the number of new vehicles added to the roadway network would be small. For example, even if one-half of all ferry passengers were to travel to Sausalito (a conservatively large portion given the number of ferries that travel directly between San Francisco and Sausalito and the potential lack of TNC or other for-hire vehicle availability to arrive at one time given the lower relative density of demand for such for-hire vehicles compared to other places in the Bay Area (e.g., downtown San Francisco)), that would mean 125 passengers per ferry would travel to Sausalito. Based on the analysis in the PMND, average vehicle occupancy for visitors who arrived at the Pier 31 ½ Embarkation Facility in San Francisco was 3.9 persons per vehicle. It is reasonable to assume this represents an average group size, regardless of arrival mode in San Francisco. Assuming a vehicle occupancy of 3.9 passengers per vehicle means the 125 passengers per ferry would occupy 32 vehicles. Finally, if people were taking the ferry to Fort Baker and Sausalito, it is likely that some of those trips would have occurred anyway (or are currently occurring) by car, which means that the number of net new vehicle trips would be even lower than 32 for each ferry.

Thus, even under the very conservative assumption that 50 percent of Fort Baker ferry passengers eventually traveled to Sausalito, the number of net new car trips to Sausalito would likely be less than 30 vehicles per hour, even on a peak weekend. And, even if those trips happened to coincide with the peak hour of traffic volumes on Alexander Avenue, they would represent less than four percent of the existing peak weekend traffic on Alexander Avenue, north of Bunker Road.

While this relatively small (and hypothetical) increase in traffic due to TNCs traveling between Fort Baker and Sausalito would be very small in relation to the existing traffic along Alexander Road and in Sausalito, if that level of traffic were to appear at once within Fort Baker without any curbside management to facilitate safe unloading or loading of passengers, it may create some localized

congestion near the Fort Baker ferry landing. This would be a particular concern during the period when passengers disembark the ferry because they arrive simultaneously; passengers taking TNCs back to the ferry landing to return to San Francisco would likely arrive over a more dispersed period of time prior to the ferry departure, such that vehicles would not arrive simultaneously, drivers would drop off passengers, and queues would not form.

However, for the reasons described above, it is highly unlikely that passengers would disembark the ferry at Fort Baker and immediately request a TNC vehicle to transport them somewhere else that has existing ferry service, such as Sausalito. Instead, those who wish to visit Sausalito from Fort Baker would most likely chose to do so for a meal or sightseeing after completing whatever activities at Fort Baker they originally and primarily traveled for. In this instance, the instances of pick-up or drop-off would be dispersed over time during the day, and would not be concentrated at a specific location (i.e., the ferry landing); instead, they would be spread over multiple destinations within Fort Baker, and would not likely form queues or congestion at any particular point.

Thus, overall, as noted in the PMND, the project is not expected to add substantial increases in traffic, pedestrians or bicycling to Sausalito and therefore is not expected to exacerbate the existing pedestrian, bicycle, or traffic congestion levels described in the Setting section or to create new hazards or exacerbate any existing hazards. Additionally, the very small number of patrons that may travel to Sausalito by TNC vehicle, if any, would not likely create localized congestion near the ferry landing because pick-ups would be dispersed geographically and temporally.

RESPONSE TO TRANSPORTATION CONCERN

The City of Sausalito's appeal also cites the Fort Baker Plan EIS (p. 5-4), which states:

Increased visitation at Fort Baker would increase the demand for lodging, restaurant, and other tourist-oriented services in surrounding areas, especially in Sausalito, Tiburon, and San Francisco.

This statement was made in the context of the entire Fort Baker Plan, which included substantial improvements to the site's historic features and a new conference center, with new meeting space, up to 350 hotel rooms, spa, and restaurant components, an expansion to the Bay Area Discovery Museum, and parking for up to 455 vehicles. This general increase in activity at Fort Baker could reasonably be expected to generate demand for travel between the two sites, particularly for visitors with cars who would be staying at the Fort Baker conference facility for multiple days.

In contrast, the proposed Fort Baker ferry service would be for day trips for visitors from San Francisco who specifically wanted to visit Fort Baker, and not for visitors who were staying multiple days at Fort Baker for a conference who may wish to explore other parts of Marin County during their stay. While both the Fort Baker Plan and the Fort Baker ferry service could increase visitorship at Fort Baker, the types and travel patterns of visitors is different between conference attendees staying at Fort Baker and ferry passengers traveling there from San Francisco for the day. Thus, the conclusion that the Fort Baker ferry would not likely generate substantial increases in visitors to Sausalito is not inconsistent with the Fort Baker EIS.

The PMND included a detailed and adequate analysis of transportation conditions likely to be affected by the proposed project. As noted above, it is unlikely that a substantial amount of passengers would use the Fort Baker ferry to travel from San Francisco to Sausalito because there are so many direct ferries between the two cities, and the connections between Fort Baker and Sausalito are not particularly convenient. However, as noted above, even if some passengers did include a stop in Sausalito on their trip, the likely way to do so would be by TNC (e.g., Uber and Lyft) or other for-hire vehicle (e.g., taxi), and not by foot, bicycle, or transit. Even under a set of conservative assumptions, traffic volume increases would not likely be high enough to be perceptible to the public. Therefore, the project would not create new hazards or exacerbate existing hazards in and around Sausalito.

Further, as discussed on pp. 65-66 and p. 69 of the PRMD, the City of San Francisco does not use traffic congestion as a metric for assessing transportation impacts. Rather, consistent with Senate Bill 743 and recent supporting guidance from the State of California Governor's Office of Planning and Research (OPR), the City of San Francisco has adopted a VMT efficiency metric³. Thus, even if traffic from the Fort Baker ferry service were to increase congestion in Sausalito, it would not be considered a significant environmental impact.

The City of San Francisco does consider substantial conflicts between modes that create new or exacerbate existing safety problems to be a significant impact. However, as noted above, the vast majority of reported collisions in the last five years were mid-week, likely when congestion levels

³ San Francisco Planning Department, *Executive Summary: Resolution Modifying Transportation Impact Analysis*, March 3, 2016.

are lower and cars are traveling at faster speeds. The project would not be in operation mid-week, and would not likely increase bicycles or pedestrians in Sausalito on weekends, and therefore, would not exacerbate the City of Sausalito's safety concerns.

In summary, although congestion issues and conflicts between bicycles, pedestrians, and car traffic are perceived as high for the context of Sausalito, particularly during peak summer weekends, the project is not likely to contribute to that congestion or those conflicts in a meaningful way such that the project would create new significant impacts in Sausalito requiring mitigation.

We hope you have found this information helpful. Please do not hesitate to call if you have any questions.

Sincerely,
FEHR & PEERS

PROJECT DESCRIPTION:

Alcatraz Island, a national historic landmark, is part of and managed by the Golden Gate National Recreation Area, a National Park Service unit that includes numerous park facilities within the San Francisco Bay area, including Fort Mason, Fort Baker, Ocean Beach, and Crissy Field. Under the proposed project, the Park Service seeks to enter into a long-term agreement with the Port of San Francisco for the development and operation of an improved ferry embarkation site at Pier 31½ to support Alcatraz Island visitors. The Port agreement would require the Park Service's selected concessioner to renovate the marginal wharf, the Pier 33 bulkhead buildings, and portions of the Pier 31 shed building. In addition, the Park Service's partner, the Golden Gate National Parks Conservancy, would renovate the Pier 31 bulkhead building and portions of the Pier 31 shed building. Renovations would provide a combination of indoor and outdoor spaces to welcome, orient, and provide improved basic amenities for the public. The proposed project would also include other administrative and operational spaces, such as new boarding ramps and floats to support the berthing of up to three ferry boats at a time. These improvements would establish an identifiable and well-functioning facility to provide a quality experience for visitors. The proposed project would also establish limited ferry service between Pier 31½ and the existing Fort Baker pier, as well as interpretive cruises around the bay.

FINDING:

This project could not have a significant effect on the environment. This finding is based upon the criteria of the Guidelines of the State Secretary for Resources, Sections 15064 (Determining Significant Effect), 15065 (Mandatory Findings of Significance), and 15070 (Decision to prepare a Negative Declaration), and the following reasons, as documented in the Initial Evaluation (Initial Study) for the project, which is attached.

Mitigation measures are included in this project to avoid potentially significant effects. See Section F, Mitigation Measures and Improvement Measures.

In the independent judgment of the Planning Department, there is no substantial evidence that the project could have a significant effect on the environment.

Pier 31½, Port of San Francisco/Alcatraz Ferry Embarkation Project

Planning Department Case No. 2017-000188ENV

A. PROJECT DESCRIPTION

Alcatraz Island, a national historic landmark, is part of and managed by the Golden Gate National Recreation Area, a National Park Service unit that includes numerous park facilities within the San Francisco Bay area, including Fort Mason, Fort Baker, Ocean Beach, and Crissy Field (Figures 1 and 2). Under the proposed project, the Park Service seeks to enter into a long-term agreement with the Port of San Francisco for the development and operation of an improved ferry embarkation site at Pier 31½ to support Alcatraz Island visitors. The Port agreement would require the Park Service's selected concessioner to renovate the marginal wharf, the Pier 33 bulkhead buildings, and portions of the Pier 31 shed building. In addition, the Park Service's partner, the Golden Gate National Parks Conservancy, would renovate the Pier 31 bulkhead building and additional portions of the Pier 31 shed building. Renovations would provide a combination of indoor and outdoor spaces to welcome, orient, and provide improved basic amenities for the public. The proposed project would also include other administrative and operational spaces, such as new boarding ramps and floats to support the berthing of up to three ferry boats at a time. These improvements would establish an identifiable and well-functioning facility to provide a quality experience for visitors. The proposed project would also establish limited ferry service between Pier 31½ and the existing Fort Baker pier, as well as interpretive cruises around the bay.

Project Location, Existing Site Characteristics, and Operations

Pier 31½

Pier 31½ is located along the northern end of The Embarcadero and within Port jurisdiction. The existing embarkation site is located primarily in the open area between the Pier 33 shed to the north and the Pier 31 shed to the south, and to the rear (bay side) of the Pier 33 and Pier 31 bulkhead buildings. The outdoor site occupies approximately 0.95 acre along the water. The site lies within the Port of San Francisco Embarcadero Historic District. Figure 3 shows the layout of the existing embarkation site, which has been operated by Alcatraz Cruises, LLC, since 2006. The ferry embarkation site program is located on the marginal wharf,¹ except for a portable restroom facility and limited operational space located in the Pier 33 shed. The site features a portable ticket booth, several exhibits, and a small parking area of approximately 15 spaces for Park Service operations, located on the southeastern portion of the marginal wharf. There is a large canopy structure over the queuing area adjacent to the water, a seating area with café tables and chairs under eight market umbrellas, and a temporary fabric canopy over a concession stand. The Pier 33 bulkhead building is occupied by the privately-operated Alcatraz Café and Grill. A passenger loading zone compliant with Federal Accessibility Standards for tour bus operations is

¹ A wharf is a docking structure oriented parallel to the shore. A wharf built as a continuation of the shoreline is known as a "marginal wharf."

located in front of the Pier 33 building. The Pier 31 bulkhead building is vacant. There is currently one float to accommodate two berths at the existing site.

Visitors enter Pier 31½ from The Embarcadero between the bulkhead buildings. Visitor use the ticket booth, circulate through several small interpretive exhibits, and enter the covered queuing area, which has space for visitors to stand. A pre-boarding area adjacent to the gangway offers seating for those with disabilities. Visitors are guided down the gangway and on to the ferry.

In 2016, the Pier 31½ facility served 1.76 million visitors a year, which included people traveling to Alcatraz Island and other ferry destinations, as well as a small number of visitors without tickets to Alcatraz Island or other destinations but who visited the facility to enquire about tickets or learn about the island. There were 7,077 annual and 24 peak day ferry trips to Alcatraz Island via the primary embarkation site at Pier 31½, which included service to both Alcatraz Island and Angel Island (the “Alcatraz plus Angel Island Loop”). In addition, during the peak season (June to September), the concessioner operated 133 bay cruises from the site that were not associated with Park Service operations. Table 1 presents the annual, peak day, and average day number of ferry trips that occurred from Pier 31½ in 2016. Table 2 presents the annual, peak day, and average day number of visitors that visited Pier 31½ in 2016.

Total	1.76 million	6,160	4,657

1. Includes visitors to Pier 31½ who did not travel to Alcatraz Island

Visitors have several transportation options to arrive at the site, including combinations of public transit (e.g., the MUNI streetcar on The Embarcadero, bus, cable car, or Bay Area Rapid Transit), tour buses, taxis, bicycles, personal vehicles, and walking. In a 2012 Visitor Flow Survey, the Park Service found that most visitors arrive by public transportation (35 percent), walk (23 percent), or carpool (28 percent) to the site. Ample paid parking for personal vehicles is located nearby, as are many other visitor services.

Fort Baker

Fort Baker is a former U.S. Army post located in Marin County at the foot of the Golden Gate Bridge and entrance to the bay. Fort Baker comprises approximately 335 acres, including a core zone of 91 acres surrounding a parade ground and 24 historic military buildings dating from the late nineteenth century. The site also includes a historic pier, gun batteries, open space, and rocky shoreline, and is connected to the Golden Gate National Recreation Area's trail system.² Fort Baker is a federal park, which is part of the Golden Gate National Recreation Area and managed per the policies and decisions set forth in the Park Service's *Fort Baker Plan Environmental Impact Statement* (Fort Baker Plan).³ The park currently offers recreational and educational opportunities through its partners, including the Cavallo Point Lodge, the Bay Area Discovery Museum, and the Travis Sailing Center. Visitors can go fishing or crabbing off the pier at Horseshoe Cove, launch a kayak or sailboat at the boat ramp, explore the seacoast fortifications at Battery Yates on the eastern Bluff, and take walks along the waterfront and trails which provide spectacular views of the Golden Gate Bridge and San Francisco Bay.

The existing pier was built in 1937 and modified in subsequent years. There is no ferry service to Fort Baker. Currently, the pier is mostly used for recreational fishing and offers clear, unobstructed views of the bay, San Francisco, and Angel Island. The structural deck is constructed of cast-in-place concrete and is topped with an asphalt surface. The concrete deck is supported by plumb and precast-concrete piles, and lateral support to the pier is provided by rows of similar battered piles on the northeast, southeast, and southwest sides. The existing pier has significant damage and deterioration, and the precast-concrete

² National Park Service, Fort Baker Brochure, updated June 2008. Available from <https://www.nps.gov/goga/planyourvisit/upload/2008-0910-sb-foba-web.pdf>.

piles also show significant damage (in the form of large cracks, rust stains, and exposed reinforcing steel) visible above the waterline.

Project Background and Objectives

The Park Service has provided public access to Alcatraz Island from San Francisco since the 1970s, embarking from various locations in San Francisco. From 2006 to the present, the ferry embarkation site has been located at Pier 31½ on The Embarcadero. The current facility functions adequately, but the public areas are entirely outdoors, and the site has a temporary visual character that the Park Service considers inappropriate for a national park gateway. It is also too small to accommodate projected visitor levels and only supports two berths, which restricts ferry operations. The existing concession contract has been extended to expire in 2018. For a variety of reasons, the Park Service has not been able to require its concessioner to greatly improve the embarkation facility, which has led to visitor confusion, community concerns, and inconsistency in providing visitor support services. Visitor demand is expected to grow in line with a general growth in tourism in San Francisco, which will exacerbate current crowding.

The proposed project was defined and analyzed in the Alcatraz Ferry Embarkation Environmental Impact Statement (EIS).⁴ As stated in the EIS, the Park Service desires an identifiable and well-functioning facility that provides a quality welcome and support program for visitors, orients visitors to the history of Alcatraz Island, ~~and provides a connection to~~ other Golden Gate National Recreation Area parklands, ~~and orientation~~ to the national park system in general. The EIS evaluated several alternative locations for the embarkation facility: Pier 31½ and Pier 41 at the Port of San Francisco; and a site at Fort Mason. The EIS also evaluated opportunities for new or enhanced linkages to the bay and other park lands. The Draft EIS was available for public review from March 20 to June 4, 2015. After exhaustive study and review, the Park Service identified the Pier 31½ Alternative, as described herein, inclusive of developing a limited ferry service to Fort Baker and an interpretive bay cruise, as the preferred alternative among the alternatives evaluated in the EIS. The Park Service completed the final EIS in January 2017. The Park Service expects to complete the record of decision finalizing the EIS in fall 2017.

Under the proposed project, the Park Service seeks to enter into a long-term General Agreement (50 years) with the Port that will provide for the development and operation of the new ferry embarkation site at Pier 31½ to support Alcatraz Island visitors, interpretive bay cruises, and provide connections to Golden Gate National Recreation Area sites, including new limited ferry service to Fort Baker and expanded signage highlighting other regional park facilities. This development will be accomplished through two Port leases: one with the Park Service ferry concessioner and one with the Golden Gate National Parks Conservancy.

Many potential visitors are unable to obtain tickets to Alcatraz Island due to high demand. Enhanced on-shore visitor facilities would provide those visitors with interpretive information about the island. The

⁴ National Park Service, *Alcatraz Ferry Embarkation Final Environmental Impact Statement*, January 2017. Available from <https://parkplanning.nps.gov/document.cfm?parkID=303&projectID=41352&documentID=77056>.

proposed project would improve cross-bay connectivity and accommodate ~~existing and future~~ visitor demand for recreational travel to Fort Baker and the Marin Headlands, thereby enhancing the Golden Gate National Recreation Area's operational effectiveness.

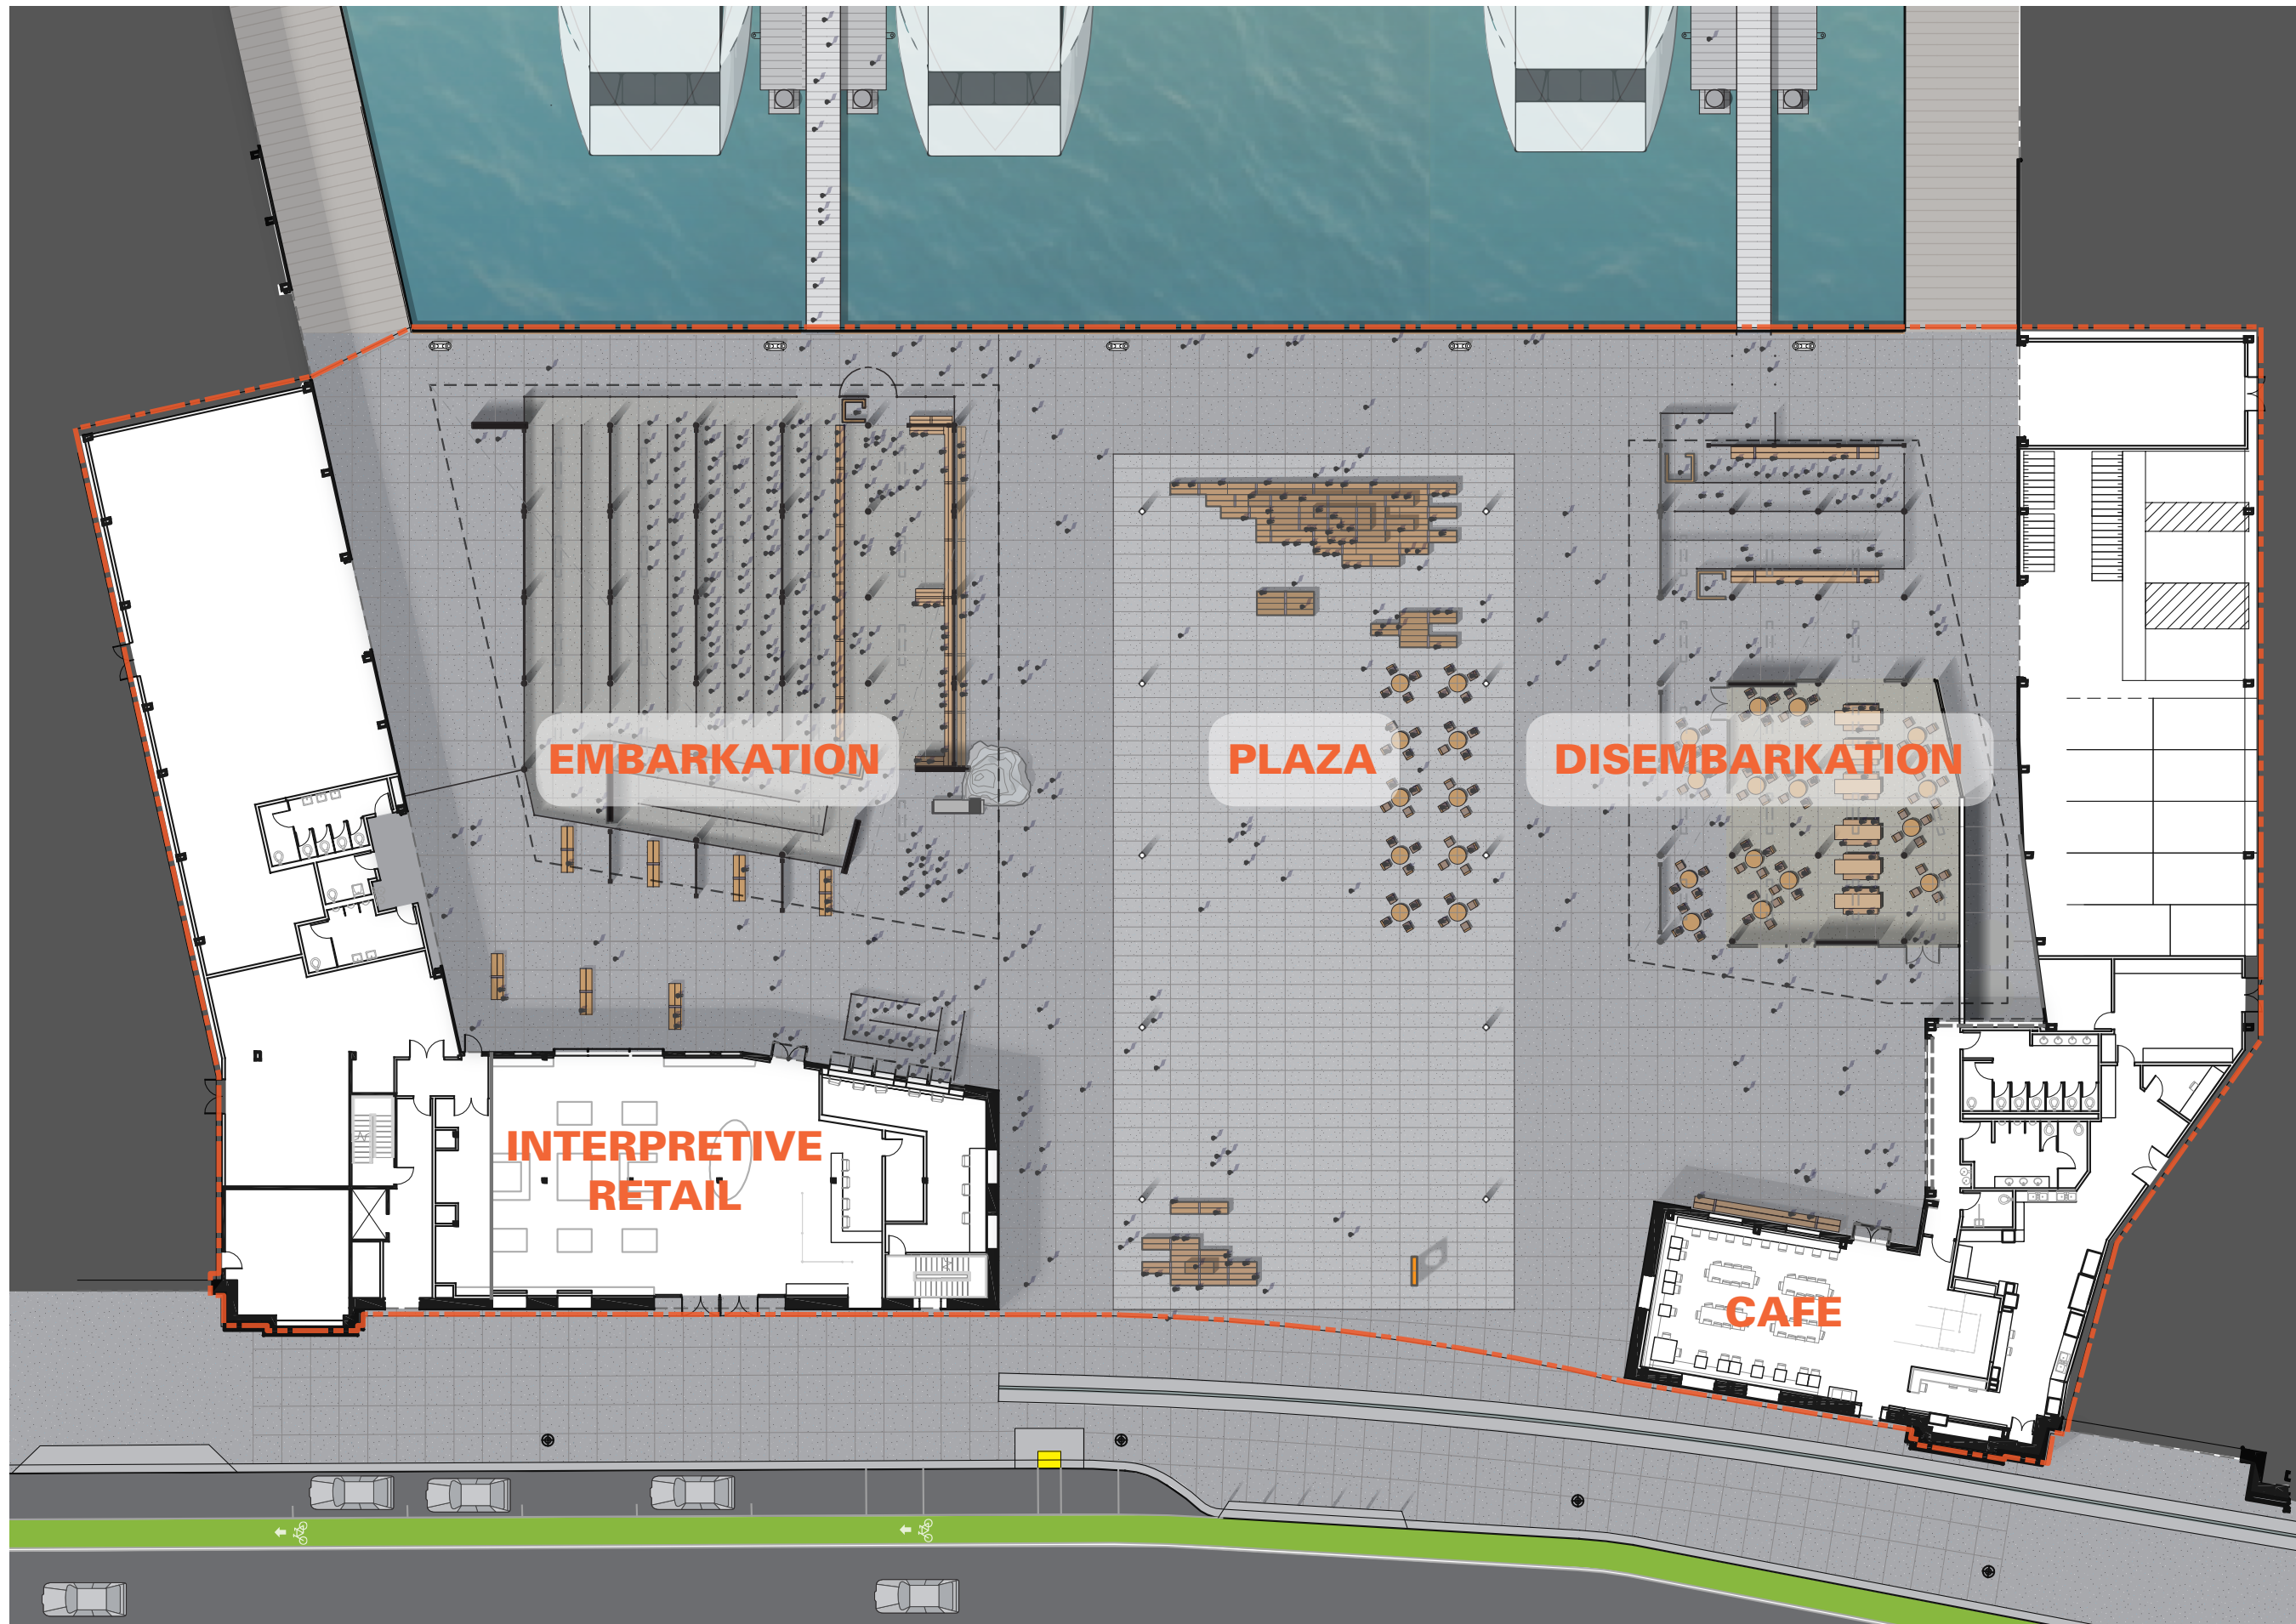

Project Components

Pier 31½

The proposed project would require improvements to the existing facility, which lies within the Port of San Francisco Embarcadero Historic District. The overall treatment philosophy is rehabilitation, informed by *The Secretary of the Interior's Standards for Rehabilitation of Historic Buildings*.⁵ The proposed project seeks to preserve and protect the original historic fabric of the pier structures, and where possible, rehabilitate and restore original fabric. The marginal wharf in between the pier structures would be rehabilitated in a manner that is sensitive to its historic open, utilitarian character as a site for berthing large vessels and loading/unloading cargo.

The proposed project would renovate the Pier 31 and Pier 33 bulkhead buildings on The Embarcadero, portions of the sheds at Pier 31 and Pier 33, and all the outdoor space between Piers 31 and 33 for embarkation services (Figure 4). The proposed project would remove the existing parking and exhibits to create an open civic plaza in the center of the marginal wharf that would welcome the public and improve access to the waterfront (Figures 5 and 6). The proposed project would remove the non-historic canopy structure and construct two new canopies adjacent to the pier sheds to protect and organize visitor queuing and boat operations. The interiors of both bulkhead buildings would be reconfigured, while restoring the exterior historic features to the extent feasible (Figure 7). The existing single dock and gangway would be relocated and replaced with two parallel floating docks and gangways (to accommodate three berths) accessed from the existing wharf (Figure 8).

Figure 5
Site Program

Figure 6
View of Pier 31½ from The Embarcadero under the Proposed Project

The following improvements would take place at the Pier 31½ project site:

- **In-Water Infrastructure:** The existing berth would be removed, and two new berths would be installed, each consisting of an accessible gangway, float, and guide piles. A total of 12 hollow steel piles, 24 to 36 inches in diameter, would be driven to depths up to 90 feet below the water; no fill material would be removed during the process.
- **Marginal Wharf:** Queuing outside the Pier 33 Bulkhead Building would be reorganized and the existing white canopy replaced with a concrete canopy. Seating, ticket confirmation and check-in booths, interpretive panels, and an information display would be added to this area.
- **Ticketing Queue and Infrastructure:** New ticket windows would be added to the east façade of the Pier 33 Bulkhead Building. Restoration work would also occur along the same façade, including restoration of historic windows and removal of post-1949 additions.
- **Interior Renovations to the Pier 33 Bulkhead Building and Shed:** The Pier 33 Bulkhead Building has existing second and third floors. The space would be modified to accommodate exhibits, interpretive retail, storage, restrooms, office space, and a ticketing area. The second floor would be mostly demolished (except for a small area to create a mezzanine level for offices and a mechanical platform). Portions of the shed would be renovated for public restrooms and site operations.
- **Interior Renovations to the Pier 31 Bulkhead Building and Shed:** The Pier 31 Bulkhead Building is currently an unoccupied construction zone stripped to the core shell of deck, structure, exterior framing, and roof structure. Modifications to the interior space would consist of constructing a

Case No. 2017.000188ENV: Pier 31.5, Port of San Francisco/Alcatraz Ferry Embarkation Project

Figure 8
New Dock Arrangement

café, space for food preparation, and storage. Portions of the shed would be renovated for public restrooms, public bicycle parking, disabled visitor parking, staff parking, and site operations.

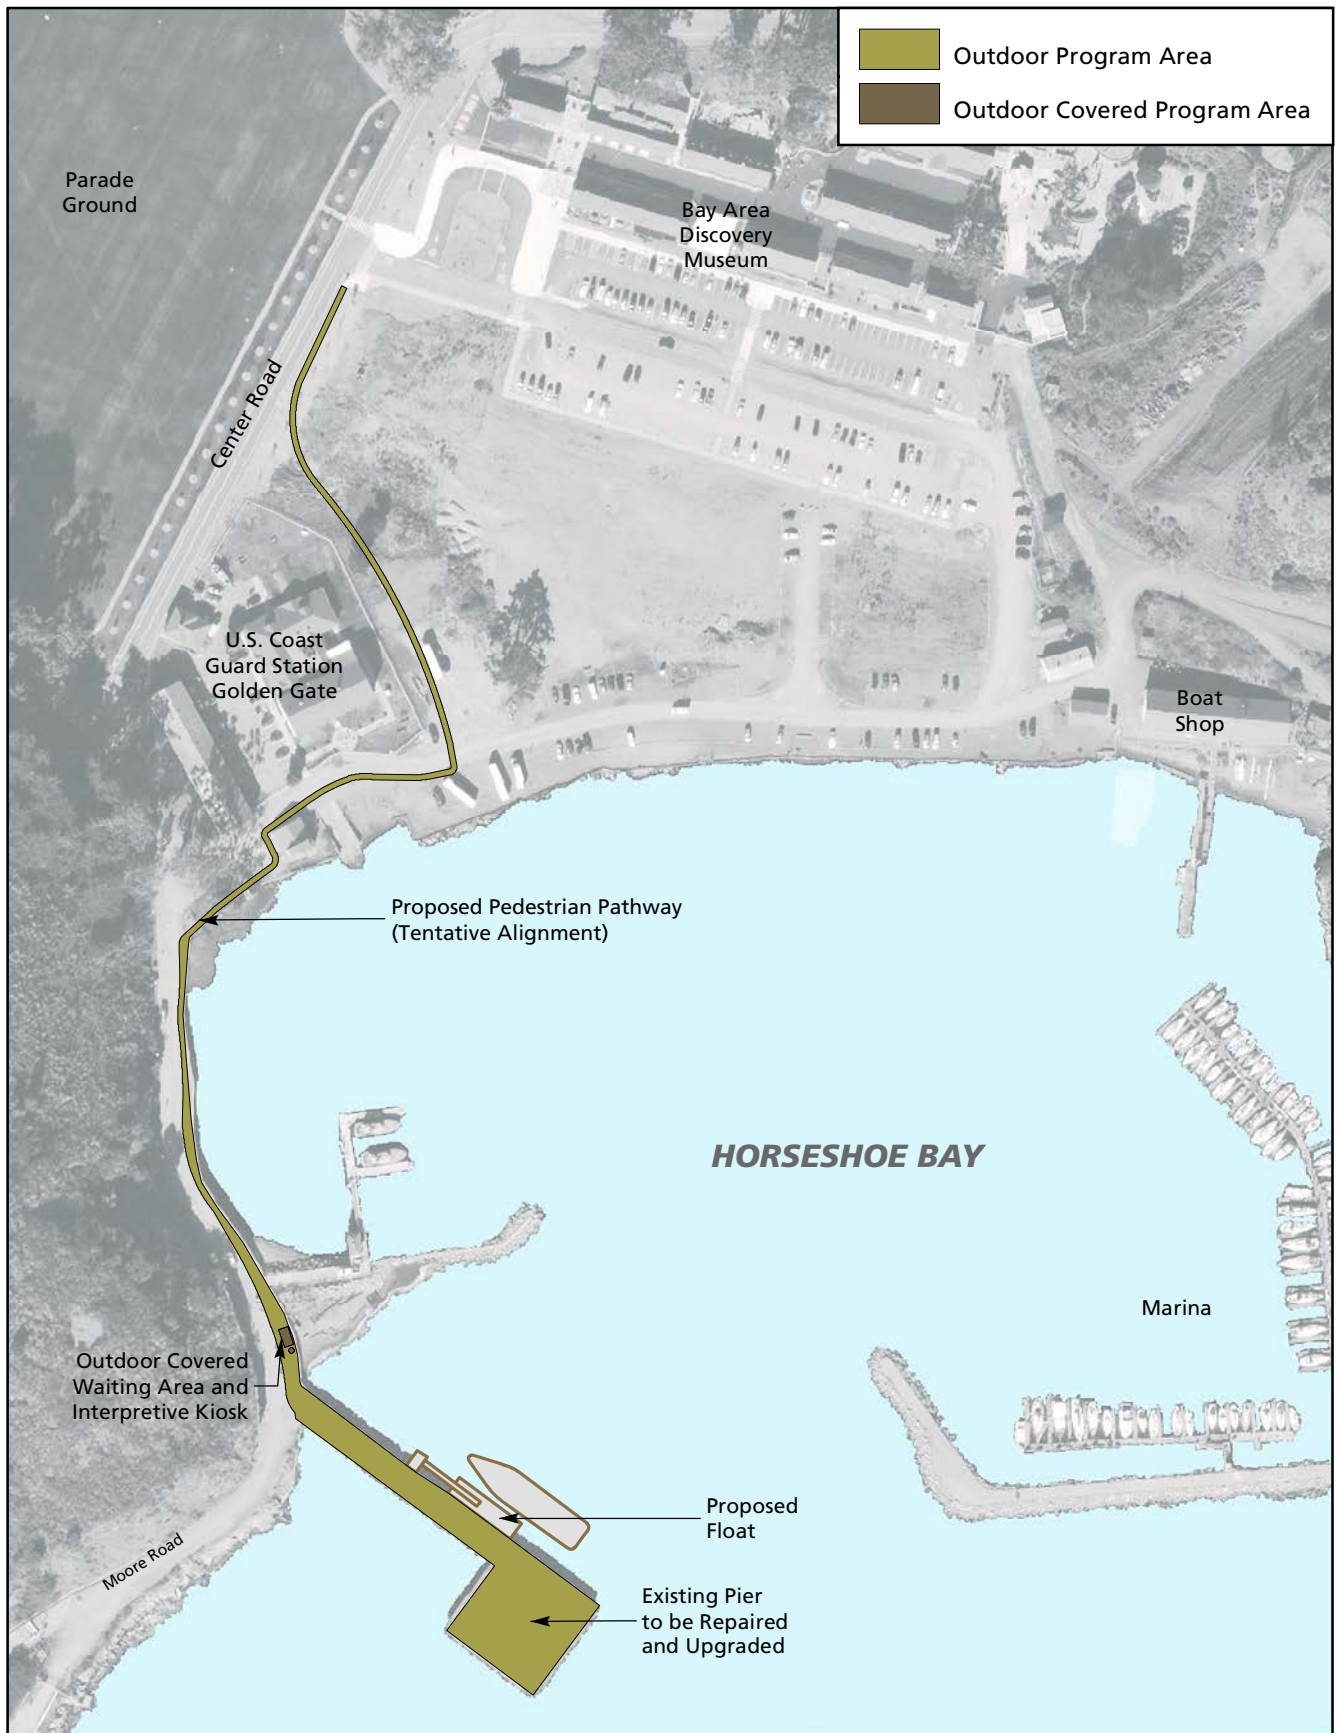

- **Café Seating and Additional Queuing Area:** Queuing outside the Pier 31 Bulkhead Building would be reorganized and the existing white fabric canopy replaced with a concrete canopy made in part of glass panels that would allow more natural light through than the existing fabric panels. Seating, interpretive panels, and a dining area with tables and food stalls would be added.
- **Civic Plaza:** The existing parking, seating, sign, and interpretive displays would be replaced with low bench seating and a monument sign, as well as space for tables and chairs. The surface of the plaza would be improved.
- **Emergency Generator:** An emergency backup generator would be installed.
- **Loading Zone:** A new 110-foot vehicle loading zone would be developed along The Embarcadero between the site entrance and the Pier 33 driveway. The loading zone would be separated from the roadway and bike lane by flexible bollards and could accommodate a queue of five vehicles.
- **Bicycle Parking:** Additional bicycle parking and related signage would be installed at the site.

Fort Baker

Figures 9 and 10 show the concept plan and a perspective sketch of the proposed improvements to the Fort Baker pier, respectively. The construction necessary to establish ferry service at Fort Baker would primarily involve repairs and upgrades to the existing massive concrete pier, which was constructed for military purposes in the late 1930s.

The following improvements would take place at Fort Baker and be overseen directly by the Park Service:

- **Pier Infrastructure:**
 - Damaged concrete and reinforcing bars would need to be repaired and replaced on portions of the deck soffit and bulkhead wall.
 - Fender piles, the asphalt paving on top of the deck, and the existing guardrails would be replaced.
 - A new gangway and float would be installed. A total of four new piles would be installed for the gangway landing, and four new steel guide piles would be installed for the float. Piles would be 30 to 36 inches in diameter and driven to depths up to 90 feet.
- **Pedestrian Pathway:** A new pedestrian pathway (approximately 1,400 feet) would be constructed to connect the Bay Area Discovery Museum and Cavallo Point Lodge with the pier. These upgrades would include adding Americans with Disabilities Act-compliant ramps to the Murray Circle sidewalk where it intersects the access road between Murray Circle and McReynolds Road just north of East Road.
- **Signage:** Maps and interpretive signage would be installed near the pier to orient visitors to Fort Baker facilities and nearby trails.

Figure 10
Fort Baker Perspective Sketch

Project Operations

Pier 31½

Visitor demand is expected to grow in line with a general growth in tourism in San Francisco. Park Service modeling forecasts that 7,790 visitors could visit the primary ferry embarkation site per day, or 1.9 million visitors per year, in 2018. These numbers include both ticketed passengers and visitors to the site without tickets, as well as passengers taking part in interpretative bay cruises and limited ferry service to Fort Baker.

While site operations would be similar to existing conditions—visitors would continue to embark from the site to Alcatraz Island and there would still be a gift shop and café—expanding services into the bulkhead buildings would increase the site’s functional area and enhance interpretation compared to existing conditions. New public restrooms in the Pier 31 and 33 sheds would expand the capacity and replace the portable restrooms presently in use (Figure 7).

The site would be designed to provide a logical flow for visitors and enhance the overall visitor experience over the entire site, from the curb to the berth. The new vehicle loading zone would better manage visitor drop-off/pick-up activities and improve safety for passengers, drivers, and cyclists during such activities. The general public would have access to the center of the site, including the waterfront edge, extending the Port’s Bayside History Walk. Most of the proposed project elements would continue to be in the outdoor areas between Piers 31 and 33, including interpretive and rest areas, ferry queuing, and boat staging. The proposed project also includes a food service area and space for exhibits and sale of interpretive products in the bulkhead buildings. These improvements would also accommodate people who are not visiting Alcatraz Island and include information on other recreational options in the national park system. The additional berth would support the interpretative bay cruise and limited service to Fort Baker. There are no plans to accommodate bicycles on the ferry boats.

Table 3 presents the annual, peak day, and average day number of ferry trips anticipated to occur from Pier 31½ by 2020 under proposed project conditions. Ferry trips are not expected to grow over 2020 numbers. Table 4 presents the annual, peak day, and average day number of visitors (1.7 million) anticipated to visit Pier 31½ under proposed project conditions. As shown in Tables 2 and 4, visitor levels to Alcatraz are not expected to grow over current levels. The increases in the Alcatraz destination ferry trip numbers, as presented in Table 3, are the result of changing schedules and peak demand, not the result of improvements at Pier 31½. A variety of vessels of different passenger capacities (ranging from 125 to 350 passengers) currently serve Alcatraz, and it is expected that the general fleet mix would stay the same. Trips to Fort Baker would be limited to two per day and would occur on weekends only. As part of the proposed project, and discussed in more detail below, the Park Service would require that all ferries meet U.S. Environmental Protection Agency Tier 3 engine standards within 2 years of the agreement.

TABLE 3
FERRY TRIPS FROM PIER 31½ UNDER PROPOSED PROJECT CONDITIONS

Destination	One Way Distance from Pier 31½ (nautical miles)	2020 to Project End		
		Number of Annual Calls (calls/year)	Number of Peak Day Calls (calls/day)	Number of Average ⁴ Day Calls (calls/day)
Alcatraz ¹	1.5	7,136	22	18
Alcatraz Plus Angel Island Loop	5.5	354	2	2
Interpretive Cruise ²	8	450	3	2
Fort Baker ³	4	208	2	1
Total		8,148	29	23

1. Alcatraz trips would be offered daily.

2. Interpretive cruises would be offered daily during peak season only (May – September)

3. Fort Baker trips would be offered on weekends only.

4. “Average day” refers to a typical off-peak day, not a mathematical average.

TABLE 4
VISITOR NUMBERS UNDER PROPOSED PROJECT CONDITIONS

Destination	Annual	Peak	Average Daily ²
Alcatraz ¹	1.7 million	6,040	3,955
Alcatraz Plus Angel Island Loop	46,000	500	500
Interpretive Cruise	90,000	750	500
Fort Baker	40,000	500	250
Total	1.9 million	7,790	5,205

1. Includes visitors to Pier 31½ who do not travel to Alcatraz Island

2. “Average daily” refers to a typical off-peak day, not a mathematical average.

The following conditions will be required by the Park Service as part of the concession contract and therefore an enforceable part of the proposed project. The selected concessioner will need to meet the below ferry requirements, at minimum, to reduce emissions. The Park Service recognizes that the concessioner may have non-Tier 3 propulsion engines initially, and allows for a 24-month grace period from the effective date of the concession contract. While the 24-month grace period will be allowed if needed, the Park Service prefers all engines at a minimum meet the Tier 3 emission standards on each vessel as soon as possible after the effective date of the concessioner agreement. Contract requirements include the following:

- Project Condition 1: Tier 3 Propulsion Engine Requirements. Within 24 months of the effective date of the concession contract, all diesel-powered propulsion engines shall meet the published United States Environmental Protection Agency emission standards for Tier 3 engines as specified in 40 Code of Federal Regulations (CFR) Part 1042 for the class of engine in use. All auxiliary engines must meet at least Tier 2 engine standards. Please note:
 - Tier 1 propulsion and auxiliary engines are no longer compliant with the California Air Resources Board Commercial Harbor Craft Regulations and compliance with this measure

does not eliminate the requirement for the concessioner to comply with applicable California Air Resources Board Commercial Harbor Craft regulations.

- California Air Resources Board Commercial Harbor Craft regulations require the use of California ultra-low sulfur diesel.
- Project Condition 2: Alternative Fuels and Technologies. The Park Service will only consider proposals for using alternative fuels or alternative fuel conversion technologies, including but not limited to, bio-diesel, ethanol, natural gas, propane, or other fuels, if the proposal is able to provide the U.S. Environmental Protection Agency Certificate of Conformity that demonstrates the engines meet or exceed the U.S. Environmental Protection Agency emissions standards for Tier 3 engines when using the alternative fuel. All conversion technologies must be U.S. Environmental Protection Agency-compliant.
- Project Condition 3: Hybrid-electric and Fully Electric Power Systems. As an alternative to Tier 3 propulsion engines, use of hybrid-electric or fully electric power systems may be proposed. The Park Service considers a “hybrid-electric power system or vessel” to be one that relies on some combination of electric (i.e., battery) and diesel or alternative fuel to generate onboard propulsion and auxiliary power. The Park Service considers a “fully electric power system and vessel” to be one that does not have any diesel or alternative fuel engines onboard and instead uses onboard batteries to supply all vessel propulsion and auxiliary power needs. The Park Service assumes that offerors proposing to use fully electric power systems (i.e., batteries instead of diesel or alternative fuel engines) would result in no direct engine emissions, as this system would not operate diesel or alternative fuel engines to produce electrical power.
- Project Condition 4: Idling Limits. Ferries will be restricted to a limit of 15 minutes idling at berth (propulsion and auxiliary engine).

Site transportation access and arrival options would be generally consistent with those of existing conditions, with a few key modifications. There are two existing bicycle racks, each accommodating approximately 20 bicycles. These racks and a small staff parking area currently located on the south side of the marginal wharf would be relocated inside the Pier 31 shed building. The current staff parking area accommodates approximately 15 parked cars, although no parking stall lines are provided. The proposed project would provide eight tandem parking stalls, as well as three Americans with Disabilities Act-designated parking stalls in the interior of the Pier 31 shed building. The Americans with Disabilities Act-designated parking stalls would be compliant with Federal Accessibility Standards. A new Federal Accessibility Standards-compliant 155-foot vehicle loading zone would be developed along the Embarcadero between the site entrance and the Pier 33 driveway. The loading zone would have one entrance and exit, would be separated from the roadway and bike lane by flexible bollards, and would provide 110 feet of usable curb space, accommodating a queue of five to six vehicles. A similar design is used on the Embarcadero in front of the Exploratorium. The proposed loading zone would remove five standard and one Americans with Disabilities Act-designated parking space from the curbside. The three new Americans with Disabilities Act-designated spaces provided in the Pier 31 bulkhead building would

serve visitor needs at the Pier 31½ site, and this curbside Americans with Disabilities Act-designated space would be relocated to the north, between the Pier 33 driveway and the Bay Street intersection.

The existing Federal Accessibility Standards-compliant drop-off zone for tour buses and persons with disabilities, measuring approximately 45 feet in length, would remain north on the Embarcadero, adjacent to the Pier 35 bulkhead building. Commercial loading would continue to occur inside the Pier 33 and Pier 31 bulkhead buildings with no changes proposed to the existing bulkhead driveways or curb cuts. Visitors on foot would still enter this site from the Embarcadero, between the two bulkhead buildings. However, because the staff parking would be removed from the marginal wharf under the proposed project, the entry, measuring approximately 115 feet, would encompass the full space between the buildings. Additional pedestrian access would be provided through the interior of the Pier 33 bulkhead buildings. The current project driveway, measuring approximately 32 feet, would be closed to vehicles, with the exception of emergency vehicles and after-hours fuel trucks; these exceptions would be permitted through the installation of collapsible bollards along the current driveway.

Fort Baker

It is anticipated that a maximum of roughly 40,000 visitors per year would travel to Fort Baker from Pier 31½ under the proposed project. The ferry service would operate on a limited basis on weekends only and the concessioner would not be permitted to sell tickets at Fort Baker, in an effort to promote pedestrian-only visits to Fort Baker. ~~based on a variety of operational and physical constraints, including limited parking at Fort Baker and the potential to congest roads nearby in Sausalito.~~ All trips would be same-day, roundtrip, departing from and returning to the Pier 31½ site. There would be no alterations of the existing parking near the pier (Figure 9), and no shuttle service would be provided to serve ferry passengers. The proposed pedestrian path would require updating existing pedestrian infrastructure on the pier and the path between Cavallo Point Lodge and the Discovery Museum, as well as constructing an entirely new path, measuring approximately 0.25 mile, between the Discovery Museum and pier. These upgrades would include adding Americans with Disabilities Act-compliant ramps to the Murray Circle sidewalk where it intersects the access road between Murray Circle and McReynolds Road just north of East Road. Ferry operations would use a small portion of the pier on weekends; the majority of the pier would remain open for recreational uses including fishing and sightseeing.

Project Construction

Pier 31½

At Pier 31½, construction would begin in 2019 and end in 2022, with active construction occurring over a period of 10 months. Construction of upgraded berthing infrastructure is expected to occur in 2019, with pile driving occurring from barges lasting approximately 3 days. The gangways and floats would be fabricated off site and floated into place using barges and cranes. Work would occur annually between July 1 to November 30, as described in Section E.13, Biological Resources.

Separate from installation of new berthing infrastructure, interior building and exterior plaza renovations are expected to occur in phases between 2019 and 2022, with precise phasing ultimately confirmed by the

concessioner. Work would occur on the landside using the types of construction equipment described in Table 5.

Fort Baker

At Fort Baker, construction would occur in 2023, with active construction occurring over a period of 11 months. Most of the proposed pier improvements are under-pier activities and would be performed from barges and floats staged under the pier. Pile driving from barges is expected to last 2 to 3 days. The gangway and float would be fabricated off site and floated into place using barges and cranes. Work would occur annually between July 1 to September 30, as described in Section E.13, Biological Resources. Minor improvements to upland areas, such as construction of the pathway, would occur as described above.

Construction Schedule

The construction schedule and construction equipment estimates for Pier 31½ and Fort Baker are presented in Table 5.

TABLE 5
ANTICIPATED CONSTRUCTION SCHEDULE

Task	Actions	Equipment (fuel, horsepower)	No. of pieces	Hours/day	Duration (days)
Pier 31½: Estimated Start November 2019					
Gangway/ Float Installation	Installing new float(s), gangways, platforms, and piling	Crane Barge (d, 360 hp)	1	8	30 days (6 days for pile driving)
		Tug (d, 1000 hp)	1	2	
		Support Vehicle (g, 385 hp)	2	4	
		Generator (d, 45 hp)	1	6	
		Work Boat (g, 30 hp)	2	2	
Site Demo and Preparation	Miscellaneous site demolition	Excavator (d, 165 hp)	2	8	22 days
		Backhoe (d, 180 hp)	3	8	
		Concrete Industrial Saw (d, 84 hp)	1	6	
		Haul/Dump Truck (d, 445 hp)	2	6	
Site Improvements	Paving/concrete, striping, signage, constructing railings, canopies, and entry portal, and new exterior construction	Backhoe (d, 180 hp)	3	8	66 days
		Paver (d, 200 hp)	1	3	
		Concrete Mixer/Asphalt Truck (d, 445 hp)	2	4	
		Support Vehicle (g, 385 hp)	4	8	
		Delivery Truck (d, 175 hp)	1	2	
		Dump Truck (d, 445 hp)	4	6	
Site Utility Installation	Water, sewer, storm drainage, electrical	Backhoe (d, 180 hp)	3	8	63 days
		Air Compressor, 100 CFM (50 hp)	1	4	
		Support Vehicle (g, 385 hp)	3	8	
		Delivery Truck (d, 175 hp)	1	2	
Deck Repair	Repair/replace pier top	Support Vehicle (g, 385 hp)	2	4	44 days

Task	Actions	Equipment (fuel, horsepower)	No. of pieces	Hours/ day	Duration (days)
	asphalt topping, install new deck and amenities, repair deck edge, and repair deck soffit	Generator (d, 45 hp)	1	6	
		Concrete Industrial Saw (d, 84 hp)	1	6	
		Work Boat (g, 30 hp)	2	6	
Architectural Coating	Interior wall finishing		N/A		23 days
Fort Baker: Estimated Start January 2023					
Pile/Caisson Repair	Cleaning, FRP jacket, grout injection, and hanging work platform installation and removal	Crane Barge (d, 360 hp)	1	4	160
		Tug (d, 1000 hp)	1	2	
		Support Vehicle (g, 385 hp)	2	4	
		Work Boat (g, 30 hp)	2	4	
		Generator (d, 45 hp)	1	6	
Bulkhead Repair	Cleaning, concrete patching with rebar repair	Support Vehicle (g, 385 hp)	2	4	10
		Work Boat (g, 30 hp)	2	6	
		Support Vehicle (g, 385 hp)	2	4	
Deck Repair	Repair/replace pier top asphalt topping, install new deck and amenities, repair deck edge, and repair deck soffit	Generator (d, 45 hp)	1	6	10
		Concrete Industrial Saw (d, 84 hp)	1	6	
		Work Boat (g, 30 hp)	2	6	
Fender Pile Replacement	Replace fender piling and timbers	Excavator/Barge (d, 165 hp)	1	8	20
		Crane Barge (d, 360 hp)	1	8	
		Tug (d, 1000 hp)	1	8	
		Support Vehicle (g, 385 hp)	2	4	
		Work Boat (g, 30 hp)	2	2	
		Delivery Truck (d, 175 hp)	1	2	
Gangway and Float Installation	Installing new float(s), gangways, platforms, and piling	Crane Barge (d, 360 hp)	1	8	30
		Tug (d, 1000 hp)	1	2	
		Support Vehicle (g, 385 hp)	2	4	
		Generator (d, 45 hp)	1	6	
		Work Boat (g, 30 hp)	2	2	
Site Demo & Preparation	Miscellaneous site demolition	Excavator (d, 165 hp)	2	8	10
		Backhoe (d, 180 hp)	3	8	
		Concrete Industrial Saw (d, 84 hp)	1	6	
		Haul/Dump Truck (d, 445 hp)	2	6	
Site Improvements	Construction of pathway, railings, and site amenities	Backhoe (d, 180 hp)	3	8	15
		Paver (d, 200 hp)	1	3	
		Concrete Mixer/Asphalt Truck (d, 445 hp)	2	4	
		Support Vehicle (g, 385 hp)	4	8	

Task	Actions	Equipment (fuel, horsepower)	No. of pieces	Hours/ day	Duration (days)
		Delivery Truck (d, 175 hp)	1	2	
		Dump Truck (d, 445 hp)	4	6	
Pier Utilities	Electrical for pier lighting, and pier and gangway utilities	Backhoe (d, 180 hp)	3	8	10
		Air Compressor, 100 CFM (50 hp)	1	4	
		Support Vehicle (g, 385 hp)	3	8	
		Delivery Truck (d, 175 hp)	1	2

Required Approvals and Permits

The following is a list of approvals and permits required for completion of the proposed project.

Federal Approvals and Permits

- **National Park Service:** Approval under the National Environmental Policy Act
- **U.S. Army Corps of Engineers:** Permits under Section 404 of the Clean Water Act and Section 10 of the River and Harbors Act
- **U.S. Fish and Wildlife Service:** Approval under the Endangered Species Act
- **National Oceanic and Atmospheric Administration; National Marine Fisheries Service:** Approval under the Endangered Species Act and Magnuson-Stevens Fishery Conservation and Management Act

State Approvals and Permits

- **California Office of Historic Preservation:** Approval under Section 106 of the National Historic Preservation Act
- **Regional Water Quality Control Board:** Approval under Section 401 of the Clean Water Act and Porter-Cologne Water Quality Control Act
- **San Francisco Bay Conservation and Development Commission:** Approval under the McAteer-Petris Act and the Coastal Zone Management Act
- **Bay Area Air Quality Management District:** Construction permit

Local Approvals and Permits

- **Port of San Francisco:** Approval of lease to operate at Pier 31½ includes:
 - Issuance of building permit and approval of standard construction best management practices (spill prevention, debris, and stormwater management best management practices)
 - Approval of loading zone and parking modifications

- Approval of a Stormwater Control Plan in compliance with the City’s 2016 Stormwater Management Requirements and Design Guidelines
- **San Francisco Department of Health:** Approval of a Dust Control Plan

B. PROJECT SETTING

Regional and Local Setting

Pier 31½

The project site at Pier 31½ is located along the northern end of The Embarcadero, a roadway spanning San Francisco’s eastern waterfront. The Pier 31½ site is zoned as a light industrial district, and directly across The Embarcadero is a commercial community business district. The roadway sits atop an engineered seawall constructed between the 1860s and 1920s. The Embarcadero was historically home to a short-line freight railroad which connected the numerous piers extending off the roadway into the bay. During World War II, nearly all piers along The Embarcadero were used for military activities. The Embarcadero District was listed in the National Register of Historic Places in 2002. The piers along The Embarcadero remain owned and leased by the Port, and are currently home to the Alcatraz ferry embarkation site at Pier 31½ and the Alcatraz Café and Grill at Pier 33, the James R. Herman Cruise Terminal (Pier 27), and the Exploratorium (Pier 15), among other establishments.

All piers along The Embarcadero are owned by the Port. Piers to the north of the Ferry Building (Pier 1) are sequentially labeled by even numbers (Pier 2, Pier 4, etc.), while piers to the south of the Ferry Building are sequentially labeled by odd numbers (Pier 3, Pier 5, etc.). The northeastern portion of The Embarcadero, specifically between piers 7 and 35, has historically been known as a maritime, industrial, and manufacturing area which offers cargo-shipping, ship repair, tug and barge operations, and cruise ship embarkation. However, development over the last 25 years has also introduced new open space, commercial, amusement, and parking uses in this area.

Fort Baker

Fort Baker is a former U.S. Army post located in Marin County at the foot of the Golden Gate Bridge which offers recreational and educational opportunities to visitors. Fort Baker comprises approximately 335 acres, including a core zone of 91 acres surrounding a parade ground and 24 historic military buildings dating from the late nineteenth century. The site also includes the historic pier, historic batteries, open space, and rocky shoreline, and is connected to the Golden Gate National Recreation Area’s trail system.⁶ The site is managed according to the policies and decisions set forth in the Park Service’s *Fort Baker Plan Environmental Impact Statement*.⁷

⁶ National Park Service, Fort Baker Brochure, June 2008. Available from <https://www.nps.gov/goga/planyourvisit/upload/2008-0910-sb-foba-web.pdf>.

⁷ National Park Service, *Fort Baker Plan Final Environmental Impact Statement*, October 1999. Available from <http://parkplanning.nps.gov/document.cfm?parkID=303&projectID=20244&documentID=20847>.

Within Fort Baker is the Cavallo Point Lodge at the Golden Gate, the newest retreat and conference center in the national park system, which provides historic and contemporary guest rooms and associated amenities to visitors. The lodge is also used by the Institute at the Golden Gate, a new program of the Golden Gate National Parks Conservancy, in partnership with the Park Service; dedicated to advancing environmental preservation and global sustainability. The Bay Area Discovery Museum and the Travis Sailing Center are also located at Fort Baker.⁸

Fort Baker is accessible from U.S. Highway 101 by travelling less than one quarter mile on Alexander Avenue, to Bunker Road which descends approximately one quarter mile into the Fort Baker historic post area, encircled by Murray Circle. Moore Road, a two-way roadway, provides access to the Coast Guard Station and the historic pier. East Road borders the eastern edge of Fort Baker, leading to Alexander Avenue and downtown Sausalito, approximately 2.5 miles to the north. Additional information regarding Sausalito is provided in Appendix B.

Other Projects in the Vicinity

Past, present, and reasonably foreseeable future projects occurring in the vicinity of the proposed project could result in cumulative impacts in combination with the proposed project impacts. Cumulative development in the project vicinity (generally within a 0.25-mile radius of the project sites) or development related to the proposed project in scope includes the projects shown in Table 6 that are either under construction or for which the Planning Department has an Environmental Evaluation Application on file.

TABLE 6
CUMULATIVE SCENARIO ACTIONS: PAST, PRESENT, AND FUTURE

Action Name	City Planning Number (if applicable)	Summary
Past Actions		
<i>Marin Headlands and Fort Baker Transportation Infrastructure and Management Plan (Park Service)</i>	N/A	This plan involves improving multimodal connections between Marin Headlands and Fort Baker by improving roadway surfaces and configurations, drainage structures, directional signage, and safety. Phases 1 and 2 have been completed, and included the rehabilitation/reconstruction of Upper Conzelman, Lower Conzelman, McCullough, East, Bunker, Mitchell, Old Bunker, and Field roads, the Alexander Avenue and West Bunker Road intersection, as well as several parking areas, trails, and drainage features. Additional project elements, including car-free events at Fort Baker, traffic control for special events, and paid parking within the Marin Headlands are not currently slated for implementation. ⁴
Present Actions		

⁸ National Park Service, Fort Baker Brochure, June 2008. Available from <https://www.nps.gov/goga/planyourvisit/upload/2008-0910-sb-foba-web.pdf>.

Action Name	City Planning Number (if applicable)	Summary
<i>Ongoing Maintenance Dredging of Port Piers (Port)</i>	N/A	The Port conducts regular maintenance dredging of its piers between Fisherman's Wharf and Pier 96. From 2011 to 2014, the maintenance dredging contract covered the dredging and disposal of more than 900,000 cubic yards of dredged sediment. The Port Commission recently recommended approval of the 2016-2020 contract. ⁵
<i>Ongoing Routine Repair and Maintenance of Port Facilities</i>	2016-003866ENV	The Port conducts ongoing repair and maintenance of its facilities as part of its routine maintenance program. These may include substructure and apron repair of its piers, utility upgrades, and roof repairs. Several upcoming and ongoing projects include substructure repairs to Piers 29 and 31½, roof repairs to Pier 19, and utility upgrades at Piers 23, 31, and 33.
<i>Pier 29</i>	2017-005787ENV	The project seeks to adapt the interior central and southern portion of the Pier 29 bulkhead and a portion of the adjacent transit shed into a new retail space with food and beverage component.
<i>Pier 43½, The Embarcadero - Red and White Ferry Embarkation Improvements</i>	2017-002244ENV	Golden Gate Scenic Steamship Corporation (dba Red and White Fleet), a 124-year-old San Francisco Excursion tour boat business, seeks a new 30-year lease with the Port of San Francisco. The proposed project entails enhancing its existing business operations and public services by providing a ticket booth facility, passenger queuing and disembarking, vessel landing and berthing, guest photography and photographic sales, a passenger loading and drop off zone, the presentation of educational interpretative displays, retail sales of merchandise, onboard food and beverage services, enhancement of general public circulation within the shoreline corridor, and additional activities necessary for the support of permitted uses.
<i>Downtown San Francisco Ferry Terminal Expansion Project (WETA)</i>	N/A	The Downtown San Francisco Ferry Terminal Expansion Project would include construction of up to three new ferry gates and additional amenities at the Ferry Building's WETA ferry terminal to accommodate existing and future users. These improvements would support WETA projects currently in the planning phase, including providing new ferry service to Richmond, Berkeley, Treasure Island, Hercules, Redwood City, Martinez, and Antioch. Construction began in May 2017, expected to be completed in 2019. ⁶
<i>Seawall Lot 322-1 (88 Broadway and 735 Davis Street)</i>	2016-007850ENV	The project involves the proposed construction of two six-story buildings containing affordable family and senior housing. The first floor would provide ground floor units, commercial space, commercial parking, bike parking, and common space/social services for residents' use.
<i>Seawall Lots 323 and 324 (Teatro ZinZanni)</i>	2015-016326ENV	The project proponent proposes the following: 1) the street vacation of portions of Davis and Vallejo streets to combine the two Port-owned lots that are separated due to the presence of the streets; 2) the removal of the existing surface parking lot and pay booths; and 3) the construction of a mixed-use development that includes a theater, a hotel building, and a privately owned public plaza and park. The proposed 40-foot-tall, 28,500-sf theater would be occupied by Teatro ZinZanni and would include 3,510-square-foot historic travelling theater tent. The proposed 40-foot-tall, 155,300-square-foot hotel would include 185 rooms with a ground-floor restaurant/bar and a retail space.
<i>The Seawall Lot 337 and Pier 48 Mixed-Use Project</i>	2013.0208E	The proposed project is envisioned to be a mixed-use development comprising both residential and commercial buildings, as well as several acres of open space. The project includes 8 acres of new parks and open space and approximately 1,500 new rental homes (40% affordable to low and middle-income individuals and families), sea level rise resiliency and adaptation features, historic rehabilitation of Pier 48, and public waterfront access improvements along the Blue Greenway trail. The Final EIR is currently being prepared for the project.

Action Name	City Planning Number (if applicable)	Summary
Reasonably Foreseeable Future Actions		
<i>Embarcadero Enhancement Project</i>	N/A	The SFMTA, Port of San Francisco, San Francisco Planning Department and San Francisco Public Works Department seek to develop a Complete Streets conceptual design and cost estimate that includes a bikeway, which would be physically separated from moving or parked vehicles and pedestrians, along The Embarcadero from AT&T Park at King Street to the Fisherman's Wharf area.
<i>Pier 19-23 Temporary Flower Mart Relocation</i>	2015-004256ENV	The project involves the improvement and reuse of the existing sheds and bulkhead building located at Piers 19, 19½, and 23 in order to operate a wholesale flower market on a temporary basis, estimated to occur from late 2019 to 2023. The project would include approximately 103,000 sf for wholesale vendor stalls, circulation, and offices; 113,000 sf of parking and loading to accommodate 191 parking spaces; and supporting uses.

C. COMPATIBILITY WITH EXISTING ZONING AND PLANS

	<i>Applicable</i>	<i>Not Applicable</i>
Discuss any variances, special authorizations, or changes proposed to the Planning Code or Zoning Map, if applicable.	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Discuss any conflicts with any adopted plans and goals of the City or Region, if applicable.	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Discuss any approvals and/or permits from City departments other than the Planning Department or the Department of Building Inspection, or from Regional, State, or Federal Agencies.	<input checked="" type="checkbox"/>	<input type="checkbox"/>

This section discusses the compatibility of the proposed project with applicable zoning regulations and land use plans, and approvals and/or permits required from City departments other than the Planning and Building Inspection departments, or from regional, state, or federal agencies. The proposed project would be located entirely on Port property (Pier 31½) and Park Service property (Fort Baker). The proposed project would not require the issuance of a variance, conditional use authorization, or changes to San Francisco's Planning Code or Zoning Map. Therefore, these issues are not discussed further in this document.

The following section presents federal, local, and regional plans, policies, and goals that are applicable to the proposed project. Potential inconsistencies between the proposed project and applicable plans are also discussed. Whether a project is consistent with particular plans for which a consistency determination is required is decided at the time of project approval by the agency charged with that determination. Land use plans typically contain numerous policies emphasizing differing legislative goals, and an interpretation of consistency requires balancing all relevant policies. The board or commission that enacted a plan or policy and determines the meaning of the policy and whether an individual project satisfies the policy at the time the board considers approval of the project.

As discussed below, the proposed project would not obviously or substantially conflict with any of the plans or policies.

Federal Park Service Plans and Policies

The proposed project is subject to federal plans and policies, namely those that provide oversight of the Park Service, which owns and operates Fort Baker and would operate the Pier 31½ facility via a concessioner. These plans and policies are described in the following paragraphs.

Organic Act of 1916

The Organic Act directs the Park Service to “promote and regulate the use of the Federal areas known as national parks, monuments, and reservations... to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations” (16 USC Chapter 1).

Management of Park Service resources, including the Golden Gate National Recreation Area, is guided by these principles. This policy only applies at Fort Baker.

General Authorities Act of 1970

As mandated by the Organic Act and reaffirmed by the General Authorities Act, management of Park Service resources is guided by the fundamental principal of conserving park resources and values. In addition, these laws require the Park Service to avoid, or to minimize to the greatest extent practicable, adverse impacts on park resources and values. This policy only applies at Fort Baker.

Park Service Management Policies, 2006

The proposed project is subject to the Park's Service's Management Policies and as such, Park Service decision-makers must investigate potential conflicts with proposed park uses and the National Park System's "fundamental purpose" of conserving park resources and values. In keeping with these policies, the Park Service evaluated several alternative project locations in an EIS which identified the proposed project as the preferred alternative. The Final EIS found that the proposed project would protect park resources and values.

National Park Service Concessions Management Improvement Act of 1998

Commercial services may take place within a unit of the National Park System only under certain defined and limited circumstances. Allowable commercial services may be authorized through concession contracts. A competitive selection process is mandated by the 1998 Concessions Act for concession contracts, with criteria for selection of the best proposal set out in the law, itself. The act also generally limits the maximum term of concession contracts to 10 years.

Public Law 92-589

The law calls for park management to utilize the park's resources in a manner that will provide for recreation and educational opportunities, and to preserve the recreation area, as far as possible, in its natural setting, and protect it from development and uses that would destroy the scenic beauty and natural character of the area. This policy only applies at Fort Baker.

Fort Baker Plan

Numerous plan elements have been implemented, including construction and opening of the Cavallo Point Lodge at Golden Gate and improvements to the Bay Area Discovery Museum. The plan identifies the potential for the fishing pier to provide water-based connections to other park sites in the future. The proposed project would not conflict with this land use plan. This policy only applies at Fort Baker.

City and County of San Francisco and Port of San Francisco Plans and Policies

San Francisco General Plan

The San Francisco General Plan sets forth the comprehensive long-term land use policy for the City and County of San Francisco. The general plan consists of 10 issue-oriented plan elements: air quality; arts; commerce and industry; community facilities; community safety; environmental protection; housing;

recreation and open space; transportation; and urban design. All land use documents, such as the Planning Code, area-specific plans, and redevelopment plans, must be consistent with the General Plan. The charter approved by the voters in November 1995 requires that the Planning Commission recommend amendments to the General Plan to the Board of Supervisors for approval. This approval changes the General Plan's status from an advisory to a mandatory document and underscores the importance of referrals establishing consistency with the General Plan before actions by the Board of Supervisors on a variety of actions.⁹ Plan elements relevant to the proposed project are briefly described as follows:

- Air Quality Element: Promotes clean air planning through objectives and policies that ensure compliance with air quality regulations.
- Commerce and Industry Elements: Guides decisions on economic growth and change in San Francisco with the three goals of continued economic vitality, social equity, and environmental quality.
- Urban Design Element: Concerns the physical character and order of San Francisco, and the relationship between people and their environment, including the preservation of landmarks.
- Recreation and Open Space: Ensures a well-maintained, highly utilized and integrated open space and recreational system that meets the long-term needs of San Francisco and Bay Area.
- Environmental Protection Element: Addresses the impact of urbanization on the natural environment.

The proposed project would not obviously or substantially conflict with any goals, policies, or objectives of the General Plan.

Waterfront Land Use Plan¹⁰

In 1997, the Port adopted the Waterfront Plan to address how and where existing and new land uses will be located along the waterfront over the next 20 years. The plan outlines general land use policies and objectives for all property under the Port's jurisdiction, specifically regarding maritime uses, open space and public access, residential and commercial uses, and other/interim uses. Unacceptable nonmaritime uses are also identified. This plan is consistent with the Port's public trust responsibilities and the City/County's Northeastern Waterfront Area Plan.¹¹ As a component to the Waterfront Plan, the Waterfront Design and Access Element was prepared to provide goals, policies, and qualitative standards for future waterfront improvement projects, specifically regarding public access and open space, views, and historical preservation. The plan also provides general architectural criteria for piers, bulkhead sites,

⁹ City and County of San Francisco, *San Francisco General Plan*, as amended through 1996. Available from <http://generalplan.sfplanning.org/>.

¹¹ City and County of San Francisco, *Northeastern Waterfront Area Plan*, July 2003. Available from http://generalplan.sfplanning.org/NE_Waterfront.htm.

and seawall lots, as well as some site-specific architectural criteria. The proposed project would not conflict with the Waterfront Land Use Plan.

Port of San Francisco Codes, Guidelines, and Regulations

The Port of San Francisco requires compliance with a number of City of San Francisco codes, as well as specific Port codes and guidelines for all Port projects, including the following:

- 2016 Port Green Building Code¹²
- 2016 Port Existing Building Code
- San Francisco Public Utilities Commission Construction Best Management Practice Handbook¹³
- San Francisco Public Utilities Commission Construction Site Runoff Control Technical Standards and Guidelines
- City's 2016 Stormwater Management Requirements and Design Guidelines¹⁴

As applicable, construction and operation at the Pier 31½ site will comply with all regulations.

Northeastern Waterfront Plan

Branching from the General Plan, the City/County's Northeastern Waterfront Plan guides decisions made regarding land use development and urban design specific to San Francisco's northeastern waterfront. The overall goal of this plan is to promote a physical and economic environment along the waterfront that best uses the area's resources and best serves the City/County's community. The proposed project would not conflict with the Northeastern Waterfront Plan.

Regional Plans

In addition to local general plans and related documents, regional environmental, transportation, and land use plans and policies consider the growth and development of the nine-county San Francisco Bay Area. Some of these plans and policy documents are advisory, and some include specific goals and provisions that must be adhered to when evaluating a project under CEQA. These regional plans are described as follows.

Bay Area 2010 Clean Air Plan

This comprehensive document updates the Bay Area 2005 Ozone Strategy, in accordance with the requirements of the California Clean Air Act, to implement feasible measures to reduce ozone and provide a control strategy to reduce ozone, particulate matter, air toxics, and greenhouse gases

¹² Port of San Francisco, *Green Building Code*, adopted 2016 and revised May 2017. Available from <http://sfport.com/sites/default/files/Business/Docs/Permit%20Services/2016%20Port%20Building%20Codes/2016%20Port%20Green%20Building%20Code-Revised%20May%202017-Publish.pdf>.

¹³ San Francisco Public Utilities Commission, *Construction Best Management Practices Handbook*, adopted August 2013. Available from <http://sfport.com/sites/default/files/Business/Docs/Permit%20Services/SFPUC%20Construction%20Best%20Management%20Practice%20Handbook%20Aug%202013.pdf>.

throughout the region. It is administered by the Bay Area Air Quality Management District. The proposed project would not conflict with the Bay Area 2010 Clean Air Plan.

Plan Bay Area

This is a long-range integrated transportation and land use/housing strategy through 2040 for the San Francisco Bay Area to meet the requirements of Senate Bill 375, which calls on each of the state's 18 metropolitan areas to develop a sustainable communities' strategy to accommodate future population growth and reduce greenhouse gas emissions from cars and light trucks. It is administered by the Association of Bay Area Governments and the Metropolitan Transportation Commission. The proposed project would not conflict with the Plan Bay Area.

Water Quality Control Plan for the San Francisco Bay Basin

This is the San Francisco Bay Regional Water Quality Control Board's master water quality control planning document. It designates beneficial uses and water quality objectives for waters of the state, including surface waters and groundwater, and includes programs of implementation to achieve water quality objectives. The proposed project would not conflict with the Water Quality Control Plan for the San Francisco Bay Basin.

San Francisco Bay Plan and Special Area Plan

The Bay Plan^{15,16} is the San Francisco Bay Conservation and Development Commission's policy guide that designates development, recreation, and conservation uses in its jurisdiction around the San Francisco Bay shoreline and various supporting waterways and estuaries in accordance with the McAteer-Petris Act. The San Francisco Bay Plan, and the jurisdictional boundary of the San Francisco Bay Conservation and Development Commission, was amended in October 2011 to reflect climate change issues and anticipated sea level rise. Priority uses include ports, water-related industry, airports, wildlife refuges, and water-related recreation. As an extension to the Bay Plan,¹⁷ the San Francisco Bay Conservation and Development Commission worked in concert with the City's Planning Department and the Port to create the Special Area Plan. Adopted in 1975 and amended through February 2010, this plan identifies site-specific policies pertaining to all Port properties along the shoreline east of Hyde Street Pier to just south of India Basin (located in the southeastern part of San Francisco, near Hunter's Point). Additionally, based on the Bay Plan, the design guidelines handbook helps guide design decisions made on future development projects along the bay shoreline. While only advisory and not legally enforceable, the guidelines were adopted by the San Francisco Bay Conservation and Development Commission in 2005 and have influenced past recommendations and formal decisions made by the San Francisco Bay Conservation and Development Commission and its Design Review Board. The Park Service is currently

¹⁵ San Francisco Bay Conservation and Development Commission, *San Francisco Waterfront Special Area Plan*, April 1975, as amended through February 2010.

¹⁶ San Francisco Bay Conservation and Development Commission, *San Francisco Bay Plan*, adopted 1968 and reprinted 2012. Available from <http://www.bcdc.ca.gov/pdf/bayplan/bayplan.pdf>.

¹⁷ Ibid.

working with the San Francisco Bay Conservation and Development Commission to complete the Coastal Zone Management Act consistency process and a permit for the proposed project from San Francisco Bay Conservation and Development Commission will also be obtained. There are no apparent inconsistencies with the Bay Plan and the proposed project.

D. SUMMARY OF ENVIRONMENTAL EFFECTS

The proposed project could potentially affect the environmental factor(s) checked below. The following pages present a more detailed checklist and discussion of each environmental factor.

<input type="checkbox"/> Land Use	<input checked="" type="checkbox"/> Air Quality	<input checked="" type="checkbox"/> Biological Resources
<input type="checkbox"/> Aesthetics	<input type="checkbox"/> Greenhouse Gas Emissions	<input type="checkbox"/> Geology and Soils

		<input checked="" type="checkbox"/> Mandatory Findings of Significance

E. EVALUATION OF ENVIRONMENTAL EFFECTS

This Initial Study examines the proposed project to identify potential effects on the environment. For each item on the Initial Study checklist, the evaluation has considered the impacts of the proposed project both individually and cumulatively. A full discussion is included for all items checked “Less than Significant with Mitigation Incorporated” and “Less than Significant Impact,” and a brief discussion is included for items checked “No Impact” or “Not Applicable.” The items checked above in Section D, Summary of Environmental Effects, have been determined to be “Less than Significant with Mitigation Incorporated.”

Environmental impacts are numbered throughout this Initial Study using the section topic identifier followed by sequentially numbered impacts (for example, LU-1, LU-2, etc.). If needed, mitigation measures are numbered to correspond to the impact numbers (for example, M-LU-1, etc.). Cumulative impacts are discussed at the end of each environmental topic impact discussion and use the letter C to identify them; for example, Impact C-LU addresses cumulative land use impacts.

<i>Topics:</i>	<i>Potentially Significant Impact</i>	<i>Less Than Significant with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>	<i>Not Applicable</i>
1. LAND USE AND PLANNING— Would the project:					
a) Physically divide an established community?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Impact LU-1: The proposed project would not physically divide an established community. (No Impact)

The division of an established community would typically involve the construction of a physical barrier to neighborhood access, such as a new freeway, or the removal of a means of access, such as a bridge or a roadway.

The proposed project site at Pier 31½ is located entirely on Port property, and is currently being used for the same uses as those proposed. Pier 31½ is located within a waterfront tourist district, separated from nearby urban areas primarily made up of commercial uses interspersed with residential units by the Embarcadero roadway and MUNI railway tracks. The closest community is located in Telegraph Hill, which is already divided from the proposed project site by a steep hill. The proposed project features and all construction would occur on site and would not block access to adjacent areas.

Fort Baker is located on a peninsula and on federal land over a mile away from the nearest community. Proposed project construction would be restricted to the wharf and nearshore area, and would not include any additional structures or impediments that would limit access or availability to surrounding communities.

Based on this analysis, the proposed project would not physically divide an established community at either project location, and there would be no impact.

Impact LU-2: The proposed project would not conflict with any applicable land use plans, policies, or regulations of an agency with jurisdiction over the project (including, but not limited to, the general plan, Waterfront Land Use Plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect. (Less than Significant)

Land use impacts are considered to be significant if the proposed project would conflict with any plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Environmental plans and policies are those which directly address environmental issues and/or contain

targets or standards which must be met in order to preserve or improve characteristics of the City's physical environment.

The proposed project site at Pier 31½ is zoned light industrial and is located directly across The Embarcadero from a commercial community business district.¹⁸ All piers along The Embarcadero are owned by the Port. The northeastern portion of The Embarcadero, specifically between piers 7 and 35, has historically been known as a maritime, industrial, and manufacturing area that offers cargo shipping, ship repair, tug and barge operations, and cruise ship embarkation. However, development over the last 25 years has also introduced new open space, commercial, amusement, and parking uses in this area.

As discussed in Section C, Compatibility with Existing Zoning and Plans, project construction and operation at Pier 31½ and Fort Baker would not obviously or substantially conflict with any adopted environmental plan or policy. The proposed project would be compliant with all relevant environmental regulations, including the Clean Water Act, Endangered Species Act, Bay Plan, and McAteer-Petris Act (refer to Section E.13, Biological Resources, and Section E.15, Hydrology and Water Quality). Therefore, the proposed project would have a less-than-significant impact with regard to conflicts with applicable land use policies, plans, and regulations adopted for the purpose of avoiding or mitigating an environmental effect.

Impact C-LU: The proposed project, in combination with past, present, and reasonably foreseeable future projects in the vicinity of the site, would result in less-than-significant cumulative impacts on land use. (Less than Significant)

The geographic scope of potential cumulative impacts on land use encompasses the project site and nearby vicinity (within a quarter-mile radius of the project site or development related to the proposed project in scope) and includes the following projects that are either under construction or for which the Planning Department has an Environmental Evaluation Application on file (see Table 6 in Section B, Project Setting): ongoing maintenance dredging of Port piers; ongoing routine repair and maintenance of Port facilities; new retail space at Pier 29; the Pier 43½ Red and White ferry facilities; and the construction of a mixed-use development, including a new theater, and parking modifications at Seawall Lots 323 and 3243. There are no known potential projects within a quarter-mile of Fort Baker. As discussed above, the proposed project would have a less-than-significant effect regarding conflicts with applicable land use plans, policies, and regulations. Similarly, the identified cumulative projects would also be required to comply with applicable land use plans, policies, and regulations adopted for the purpose of minimizing an environmental effect. Accordingly, no significant cumulative impact related to conflicts with applicable plans, policies and regulations would result from the cumulative scenario to which the proposed project and other cumulative projects would contribute. This impact would be less than significant.

¹⁸ City and County of San Francisco, *San Francisco Municipal Code* (current through Ordinance 70-12, File No. 130085), approved April 23, 2013, and effective May 23, 2013. Available from <http://www.amlegal.com/library/ca/sfrancisco.shtml>.

<i>Topics:</i>	<i>Potentially Significant Impact</i>	<i>Less Than Significant with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>	<i>Not Applicable</i>
2. AESTHETICS—Would the project:					
a) Have a substantial adverse effect on a scenic vista?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Substantially degrade the existing visual character or quality of the site and its surroundings?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

An aesthetics or visual quality analysis considers the project design in relation to the surrounding visual character, heights, and building or structure types of surrounding uses, its potential to obstruct scenic views or vistas, and its potential for light and glare. A project would be considered to have a significant adverse environmental effect on visual quality only if it would cause a substantial, demonstrable negative change.

Impact AES-1: The proposed project would not have a substantial adverse effect on a scenic vista. (Less than Significant)

A scenic vista is generally considered to be a location from which the public can experience unique and high-quality views, typically from elevated and uninterrupted vantage points that offer panoramic views of great breadth and depth. Scenic vistas may be officially recognized or designated (e.g., within local planning documents or the Caltrans scenic highway program) or they may be informal in nature (e.g., mountain peaks or coastal bluffs). A project would have a significant effect on scenic vistas if it would substantially degrade important public views or obstruct scenic views from public areas viewable by a substantial number of people.

At Pier 31½, the proposed project includes redevelopment of the Alcatraz Island ferry embarkation facility along the Embarcadero, a popular tourist destination known for its scenic vistas. This site is within and contributes to the Embarcadero National Register Historic District. This site is located between Fisherman's Wharf and other tourist facilities, such as the cruise terminal and the Exploratorium. The site does not have views of Alcatraz Island, but does have views between the piers of San Francisco Bay towards the east. As shown in Figure 11, the project site is visible from Coit Tower in Pioneer Park, a scenic vista. Figure 11 shows Pier 31 to the right (south), Pier 33 to the left (north), the existing embarkation facility canopy, a single dock, and open areas between the two piers. In front of the

project site is The Embarcadero, which has streetcar tracks lined with palm trees running between its two lanes of traffic.

Figure 11
Existing View of Pier 31½ from Coit Tower

As shown in Figure 12, an approximate simulation of the view of Pier 31½ after construction, the proposed project at Pier 31½ would look similar to baseline conditions. Buildings would be the same height with restored historic character and outdoor programming would be integrated into the public waterfront area. The primary noticeable changes would be the addition of a second canopy behind the Pier 31 bulkhead building, a second gangway/dock, and renovated public spaces, including recreational and interpretative opportunities, between the two pier buildings. Parking would be moved inside the shed buildings. The proposed canopies would be located behind buildings and would generally not be visible from the Embarcadero. Therefore, improvements at Pier 31½ would not substantially affect a scenic vista and impacts would be less than significant.

Figure 12
View of Pier 31½ from Coit Tower under the Proposed Project

Figure 13
View of Fort Baker

As shown in Figure 13, views of Fort Baker consist of a concrete pier and open vistas. The proposed project includes upgrades to the existing pier, including addition of a new gangway and improved pedestrian pathway. The pier upgrades would not alter the scenic vista, as most of the improvements would be to the substructure, and therefore, would not be visible. Alterations to the pier would maintain the pier's current appearance and dimensions. Following construction, the pier would look generally as it does today. Operationally, intermittent ferry service to the pier would not alter the scenic vistas of and from Fort Baker, as ferry berthing would be short term and in line with existing maritime uses of the

surrounding area. Therefore, the proposed project would not affect scenic vistas in the area and impacts would be less than significant.

Impact AES-2: The proposed project would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway. (Less than Significant)

Scenic resources are the visible physical features of a landscape and historic structures that contribute to a unique and exemplary visual setting. The section below describes the proposed project's impact on designated scenic resources located in the vicinity of the project sites.

There are no state designated scenic highways in San Francisco.¹⁹ State routes 1 and 80 are identified as eligible for designation as scenic highways, but the Pier 31½ site would not be visible from these highways. The 49-Mile Scenic Drive is a locally designated road created in 1938 by San Francisco's Downtown Association to highlight the city's beauty and to promote it as a tourist destination. This scenic roadway includes portions of The Embarcadero south of the ferry building, but does not include the roadway adjacent to the project site.²⁰ The urban design element of the San Francisco General Plan rates street areas important to urban design and views and also rates city streets as excellent, good, or average for the quality of their views. The views along The Embarcadero near the project site are designated as having average views.

At Pier 31½, there are no trees, rock outcroppings, vegetation, or other natural features on the site; therefore, alterations to the site would not damage such resources. The alterations to the historic buildings visible from The Embarcadero roadway, mostly to window and door openings in keeping with the historic context, would appear to be relatively minor changes. In addition, the design would provide upgraded public access to on-site water viewpoints, which would expand opportunities for the public to view the piers and the proposed project area as a whole. Therefore, improvements at Pier 31½ would not substantially damage scenic resources and impacts would be less than significant.

There are no state designated scenic highways near Fort Baker.²¹ Fort Baker may be considered a scenic resource, as its park-like setting attracts visitors. Fort Baker does include trees and vegetation; however, the proposed construction would be restricted to the existing pier and adjacent upland area. Alterations to the pier would maintain the pier's current appearance and dimensions, with the addition of a new gangway and dock. The proposed trail would not damage any scenic resources. Following construction, the project site would look generally as it does today. Therefore, improvements at Fort Baker would not substantially damage scenic resources and impacts would be less than significant.

²⁰ <http://www.sftodo.com/maps/49-mile-scenic-drive-san-francisco.pdf>

²¹ California State Department of Transportation (Caltrans), California Scenic Highway Mapping System, San Francisco County. Available from http://www.dot.ca.gov/hq/LandArch/16_livability/scenic_highways/index.htm.

Impact AES-3: The proposed project would not substantially degrade the existing visual character or quality of the site and its surroundings. (Less than Significant)

At Pier 31½, the existing visual character of the site and its surroundings is predominantly that of the adjacent Pier 31 and 33 bulkhead and transit shed buildings. The bulkhead buildings are timber frame structures clad in stucco that is lightly scored to resemble ashlar masonry; the transit sheds are timber frame buildings with walls of reinforced concrete. The marginal wharf between these two piers contains a ticket booth, queuing areas, displays, and vehicle parking. The project site is part of the Port of San Francisco Embarcadero Historic District, which extends for three miles of waterfront including over 20 piers (see Section A, Project Description, or Section E.4, Cultural Resources, for further discussion).

As shown in Figure 12, the proposed project would look similar to the existing conditions. Modifications to window and door openings of the bulkhead buildings, proposed canopies, interpretive displays, and renovated public spaces would be compatible with the surrounding historic district with the have little effect on the overall visual character of the site. The only noticeable changes would be the addition of a second canopy behind the Pier 31 bulkhead building, a second gangway/dock, and renovated public spaces between the two pier buildings. Parking would be moved inside the shed buildings. The proposed canopies would be located behind buildings and would generally not be viewed from the Embarcadero. The proposed modifications would not degrade the existing visual character or quality of the site and its surroundings.

At Fort Baker, most of the wharf improvements would be to the substructure and, therefore, would not be visible. Alterations to the pier would maintain the pier's current appearance and dimensions, with the addition of a gangway and floating dock. Following construction, the project site would look generally as it does today, in keeping with the existing character of the waterfront park.

In summary, the proposed project would redevelop existing facilities but would not change the overall character of the existing uses, which are in line with the visual character of the surrounding areas, and would not substantially degrade the existing visual character or quality of the site and its surroundings. Therefore, there would be a less-than-significant impact as a result of the proposed project.

Impact AES-4: The proposed project would not create a new source of substantial light or glare which would adversely affect day or nighttime views in the area. (Less than Significant)

The proposed project would not introduce new sources of outdoor daytime lighting at either Pier 31½ or Fort Baker. In fact, natural lighting would be employed to a greater extent under the proposed project than with current operations. For example, the new canopies proposed for Pier 31½ would continue to provide shade and cover from inclement weather, but would include glass panels to allow more natural light through than the existing fabric panels. The proposed project would not include new structures that could cause glare. The proposed modifications to the bulkhead buildings at Pier 31½ would use similar sizes and types of windows and doors, resulting in minimal changes from existing conditions. The glass

panels in the new concrete canopy would be embedded and interspersed in the panel and would not introduce a new source of glare. Therefore, the rest of this discussion is focused on nighttime lighting.

The nighttime lighting conditions near Pier 31½ are quite bright due to the urban setting along the piers and the predominant street lighting along The Embarcadero. Along the streetcar tracks, dual lamp fixtures alternate with palm trees. These fixtures illuminate the roadway and streetcar tracks and have small shields. The existing sidewalk fixtures across the street do not employ shields, and thus contribute the greatest amount of light in the vicinity. The existing Alcatraz Landing sign lettering is illuminated, and the sign also has underlights. Within Pier 31½, the ticket booth employs lighting under its overhang. Additional lights are installed near the vessels for security and safety. The vessels themselves are also well-lit for security and safety. Overall, the area is quite bright in the nighttime, with a warmer hue of light near the street and cooler lamp colors within the pier itself.

Under the proposed project at Pier 31½, the level and character of night lighting for security, safety, and identification within the project site would remain unchanged, though lights would be upgraded and relocated, with consideration given to avoiding light pollution of darkened skies. The inclusion of a third ferry-occupied berth would minimally increase the need for security and safety lighting for the additional vessel, gangway, and float. As part of the proposed project at Pier 31½, the Park Service would require that all new and upgraded lighting employ shields over lamps or be located under building/structure overhangs to minimize light pollution of the dark sky, and new lighting for the gangways and floats would employ motion activation sensors after operational hours to minimize the amount of time lamps would be illuminated.

Current nighttime light levels at the Fort Baker pier are low, and the proposed project would minimally increase light levels through the use of security and safety lighting at the new gangway and float and on moored vessels. However, the Fort Baker area is relatively distant from most viewpoints. Similar to Pier 31½, as part of the proposed project at Fort Baker, the Park Service would require that any new lighting located on the gangways and floats would employ light shades and motion activation sensors after operational hours to minimize the amount of time lamps would be illuminated.

For these reasons, the proposed project would not create new sources of substantial light or glare that would adversely affect day or nighttime views in the area. Therefore, impacts would be less than significant.

Impact C-AES: The proposed project would not make a considerable contribution to any cumulative significant effects related to aesthetics. (Less than Significant)

The geographic scope of aesthetic impacts on scenic vistas, scenic resources, and visual character that could be affected by proposed project construction and operation include the following cumulative projects along The Embarcadero waterfront identified in Table 6 (Section B, Project Setting): Pier 29 (new retail/restaurant space); Pier 43½ (Red and White Ferry Embarkation Improvements); Downtown San

Francisco Ferry Terminal Expansion; and Seawall Lots 323 and 324 (Teatro ZinZanni hotel and theater tent).

The proposed project, when combined with other past, present, and reasonably foreseeable projects, could potentially result in significant cumulative impacts on these aesthetic resources if cumulative projects introduced a number of exceedingly large, brightly illuminated or reflective structures in the low-lying shoreline areas that disrupted views of the waterfront area or surrounding scenic vistas, or substantially impaired the visual character of the site and vicinity, a historic district. However, the proposed project and the projects listed above, with the exception of the proposed 40-foot-tall theater and hotel as part of the Seawall Lots 323 and 324 project, would consist of renovations and small structures within Port facilities subject to review for compatibility with the Embarcadero Historic District, and thus would not substantially affect the visual character and scenic resources of the site and vicinity. The proposed Seawall Lots 323 and 324 project is more than 0.5 mile from Pier 31½, and is not visually connected to the project site. None of these projects would block scenic vistas from the surrounding public viewpoints or introduce substantial amounts of light or glare. For these reasons, the proposed project, in combination with past, present, and reasonably foreseeable future projects in the area, would not result in a significant cumulative aesthetics impact.

<i>Topics:</i>	<i>Potentially Significant Impact</i>	<i>Less Than Significant with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>	<i>Not Applicable</i>
3. POPULATION AND HOUSING— Would the project:					
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Displace substantial numbers of existing housing units, necessitating the construction of replacement housing?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Impact PH-1: The proposed project would not induce substantial population growth either directly or indirectly. (Less than Significant)

In general, a project would be considered growth-inducing if its implementation would result in substantial population increases and/or new development that might not occur if the project were not approved and implemented. Population growth is considered in the context of local and regional plans and population, housing, and employment projections. Generally, a project that induces population

growth is not viewed as having a significant impact on the environment unless this growth is unplanned and results in significant physical impacts on the environment. Thus, the growth and changes in employment and population and potential demand for housing that would occur with implementation of the project would not be adverse physical impacts in themselves. However, the physical changes needed to accommodate project-related improvements may have physical impacts on the environment.

The proposed project does not include the development of residences, new roads, or related infrastructure that would remove an obstacle to growth in the area. While the proposed project would accommodate growth in visitor levels to Alcatraz Island, the proposed project itself is not growth-inducing. Future capacity at the Pier 31½ site is based on the forecasted 20% growth in visitors to the site through 2036.²² This projected growth is based on general increases in City tourism levels and population growth, as well as on-island improvements such as the Park Service either opening additional locations on Alcatraz Island for visitor use or implementing visitor management strategies that would allow for increased visitation. The growth is not induced by the proposed project; however, the proposed project is intended to accommodate the projected growth. The proposed project would provide a long-term lease for the ferry embarkation site, allowing the project proponent location certainty for investments in site improvements.

The proposed project may result in a slight increase in the number of direct and indirect jobs related to the expansion in visitor services. The potential additional workforce, likely less than 20 employees, could be readily filled by the Bay Area workforce and would not induce substantial population growth that would cause a substantial adverse physical change to the environment.

For these reasons, the proposed project would not directly or indirectly induce substantial population growth, and impacts would be less than significant.

Impact PH-2: The proposed project would not displace a substantial number of existing housing units or people, necessitating the construction of replacement housing. (No Impact)

The proposed project would not displace any housing units or people because the project site is within Port (Pier 31½) and Park Service (Fort Baker) properties, and there is no on-site housing at either the Pier 31½ or Fort Baker project sites; therefore, the proposed project would have no impact.

Impact C-PH: The proposed project would not make a considerable contribution to any potential significant cumulative effects related to population or housing. (Less than Significant)

The *Plan Bay Area*, the current regional transportation plan and Sustainable Communities Strategy adopted by the Metropolitan Transportation Commission and Association of Bay Area Governments in July 2013, contains housing and employment projections for San Francisco through 2040. *Plan Bay Area*

²² ORCA Consulting, LLC, *America's Cup 34 Spectator Sites on NPS Properties Visitation Estimate and Capacity Assessment Preliminary Report*, December 2011.

projections provide context for the population and housing cumulative analysis. Cumulative development in the project vicinity would result in an intensification of land uses and cumulative increases in the residential and employment populations at the neighborhood, citywide, and regional levels. This cumulative growth is consistent with the projections presented in *Plan Bay Area*. As discussed under Impacts PH-1 and PH-2, the proposed project's contribution to cumulative growth would not be substantial and it would have no contribution to displacement of housing units or people. Therefore, the proposed project in combination with past, present, and reasonably future projects would not result in a significant cumulative impact related to population and housing.

Topics:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact	Not Applicable
4. CULTURAL RESOURCES—Would the proposed project:					
a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5, including those resources listed in Article 10 or Article 11 of the San Francisco Planning Code?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Disturb any human remains, including those interred outside of formal cemeteries?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Cause a substantial adverse change in the significance of a tribal cultural resource as defined in Public Resources Code §21074?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

The study area for analysis of cultural resources and tribal cultural resources is known as the Area of Potential Effect, as defined in Section 106 of the National Historic Preservation Act, and its implementing regulations at 36 Code of Federal Regulations 800.4. The Area of Potential Effect is the geographic area or areas within which an undertaking may adversely affect historic properties (36 Code of Federal Regulations 800.16[d]). This is consistent with the CEQA requirement to determine whether a project will cause a substantial adverse change in the significance of a historical resource. The proposed project has undergone separate Section 106 review, and the Area of Potential Effect has been determined in consultation with Native American tribes and the State Historic Preservation Officer. The proposed project would occur within the boundaries of the Port of San Francisco Embarcadero National Historic District and the Fort Baker portion of the Forts Baker, Barry, and Cronkhite National Historic District, both of which are listed in the National Register of Historic Places. Therefore, the study area (Area of Potential Effect) includes the entirety of both districts, because effects to a property within a district could potentially affect the significance of the whole district.

Impact CR-1: The proposed project would not result in a substantial adverse change in the significance of a historical resource as defined in §15064.5, including those resources listed in Article 10 or Article 11 of the San Francisco Planning Code. (Less than Significant)

Historical resources are those properties that meet the definitions in Section 21084.1 of the CEQA statute and Section 15064.5 of the CEQA Guidelines. Historical resources include properties listed in, or formally determined eligible for listing in, the California Register of Historical Resources or in an adopted local historic register. Historical resources also include resources identified as significant in a local historical resource survey meeting certain criteria. Additionally, properties that are not listed but are otherwise determined to be historically significant, based on substantial evidence, would also be considered historical resources. This section addresses impacts to historical resources of the built environment. A historical resource is materially impaired when a project “demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance.”

The proposed project includes alterations to Piers 31 and 33. The bulkhead buildings, transit sheds, and wharfs that comprise the piers are contributing structures to the Port of San Francisco Embarcadero Historic District. The district is historically significant for the time period of 1878 through 1946, in the areas of Government, Commerce, Transportation, Labor, Architecture, Engineering, and Community Planning and Development. Proposed project work would generally restore historic conditions and would follow the Secretary of the Interior’s Standards for Rehabilitation of Historic Buildings²³, which provide a framework and guidance for decision-making about work or changes to a historic property. A project meets the Secretary of the Interior’s Standards when the overall effect of all work on the property is one of consistency with the property’s historic character. Determination that a project meets the Secretary of the Interior’s Standards is based on the cumulative effect of all the work in the context of the specific existing conditions, evaluated through the professional review of the State Historic Preservation Office, the Park Service, and the Port of San Francisco. The Port Commission adopted Resolution 04-89 in 2006, which requires that Port staff review projects involving alteration, construction, or demolition within the historic district for consistency with the Secretary of the Interior’s Standards.

Table 7 lists the proposed project work and effects to the Port of San Francisco Embarcadero National Historic District.

²³ 36 Code of Federal Regulations 67

TABLE 7
PROJECT EFFECTS ON THE PORT OF SAN FRANCISCO EMBARCADERO
NATIONAL HISTORIC DISTRICT

Structure	Elevation	Planned Work	Effect on Historic District
Pier 33 Bulkhead Building	South	Removal of awnings placed in 2012	Removal of the recent awnings will have no effect because they were added after the period of significance and are not historic.
		Replacement of a shallow arch (which originally held a coiling door and was filled in between 1949 and 1985) with a curtain wall and door	Replacement of the arch would restore some of the transparency of the large original coiling door opening. Both changes would enhance the integrity of feeling, association, and design by restoring historic views and the historic appearance of the elevation.
	East	Restoration of two large windows which were filled in between 1949 and 1985	Restoration of the original 1918 windows (now infilled) and removal of two later windows would enhance integrity of feeling and design by restoring the original appearance of the elevation. Restoration work will be in compliance with SOI #6 ("distinctive materials, features, finishes, and construction techniques that characterize a property will be preserved") and #9 ("new additions, exterior alterations or related new construction will not destroy historic materials, features, and spatial relationships that characterize the property").
		Filling in two small windows which were installed post-1949	
	North	Addition of ticket windows at the location of two post-1949 windows at the eastern extent of the elevation.	Conversion of two post-1949 windows (added after the period of significance) to ticket windows would not change any of the historic fabric of the structure, and does not represent a change in the balance or massing of the façade.
		Restoration of windows on the outer end of the façade (currently infilled)	Restoration and the installation of a new glazed opening that is in line with the opening on the south elevation would restore historic views and enhance the integrity of feeling and design by returning the elevation to its appearance during the period of significance. The restored windows will be constructed in compliance with SOI Standards #9.
		Infilling of a post-1949 door, louvre, and window on the inner end of the façade	Infilling of the door, louvre, and window would restore the historic appearance and enhance the integrity of feeling and design by returning the elevation to its appearance during the period of significance.
		Alteration of existing view of the elevation by removal of existing non-permanent features on the marginal wharf (canopies, seating, kiosks, signage, and planters), and replacement with new concrete canopies, signage, seating, and queuing appurtenances	New non-permanent features would not destroy any historic fabric and are reversible. The height, thickness, and the angle of the new canopies were carefully chosen for maximum transparency, so that pedestrians entering the site from the Embarcadero would be presented with the edge of the canopies at a height that reveals the pier shed and bulkhead building beyond. This constitutes a reduction of effect on the view, as compared to the current canopies. The design of the canopies would be contemporary, simple, and industrial in design.

Structure	Elevation	Planned Work	Effect on Historic District
Pier 33 Transit Shed	North	Pinning a post-1949 steel coiling door in open position to allow insertion of a restroom “box” set back into the volume of the bulkhead beyond	The restroom “box” insertion into the non-historic door would not affect the scale or massing of the façade. It would be separate from the historic fabric and reversible in keeping with SOI Standards #10 (“new additions...will be undertaken in such a manner that, if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired”).
Pier 31 Bulkhead Building	South	Replacement of an existing door with an accessible door made of appropriate historic materials (such as wood, glass, and concrete)	To minimize effects to integrity of design, workmanship, and materials, the installed doors would use appropriate historic materials (such as wood, glass, and concrete) and scale, and would be visually consistent with other doors on both the Pier 31 and Pier 33 bulkhead buildings. The proposed new openings would be contemporary in construction while matching the proportions and materials of the historic windows, in compliance with SOI Standards #9.
	North	Replacement of one historic double height window with a door	
Pier 31 Transit Shed	North	Two historic coiling doors would be pinned in open position to allow insertion of the restroom “box” into the volume of the bulkhead beyond.	The restroom box addition would be separate from the historic fabric and reversible in keeping with the SOI Standards #9 and #10. The pinning open of the coiling doors would also be reversible in keeping with the SOI Standards #6.
		The non-historic coiling door on the non-historic addition would be pinned open to allow the insertion of a “box” entrance to the café.	The café “box” entrance insertion is in the non-contributing addition, and would not affect the scale or massing of the façade.
All Structures	All Elevations Where Work is Proposed	Minor repairs and painting	Repairs would be completed in compliance with the SOI Standards #6, which requires that “distinctive materials, features, finishes, and construction techniques that characterize a property will be preserved.”

Note:
SOI: Secretary of the Interior

The proposed project would affect the historic district at Piers 31 and 33. As shown in Table 7, most changes involve the restoration of historic appearance and therefore would be consistent with preservation goals and the Secretary of the Interior’s Standards. Work at the Pier 31 bulkhead building includes some alterations that would replace historical doors and windows with new window and door assemblies, but effects would be minimized through adherence to the Secretary of the Interior’s Standards, as detailed in Table 7.

The proposed project also includes work in Fort Baker National Historic District. The District is also a Cultural Landscape in the category of designed landscapes, as documented by the Park Service and significant for the coastal defense history of the site.²⁴ The Fort Baker pier is a contributing property to the

²⁴ National Park Service, *Cultural Landscape Report for Fort Baker, Golden Gate National Recreation Area*, 2005. Available from http://www.nps.gov/history/history/online_books/foba/clr.pdf.

Forts Baker, Barry, and Cronkhite National Historic District (historical documentation labels it the Mine Wharf). Treatment guidelines in the 2005 Fort Baker Cultural Landscapes Report prioritize the preservation of “work-related industrial development around Horseshoe Cove including breakwater, seawalls, wharves, ramps, and ship repair structures which define the industrial character of the waterfront,” and note that “management of the waterfront focuses on redevelopment for recreational use, within the general framework of preservation, of the contributing resources and character of the cultural landscape as a working waterfront.” Therefore, retaining and rehabilitating the historic Mine Wharf is consistent with the cultural landscape treatment guidelines. Replacing materials in-kind would preserve the industrial character of the wharf. Further, rehabilitating the wharf would prevent it from falling into disrepair, extending the life of the historic structure. Though some historic elements would be replaced with modern materials, the effect to the structure (and therefore to the historic district) would be consistent with historic preservation goals and the Secretary of the Interior’s Standards.

The proposed project has been analyzed under Section 106 and documented in a Finding of Effects letter from the Park Service to the State Historic Preservation Officer.²⁵ The Park Service determined that the proposed project would have no adverse effects on historic properties. The State Historic Preservation Officer concurred with this determination on August 10, 2017.²⁶ The City of San Francisco Planning Department has reviewed the proposed project for impacts to historical resources, and prepared a report of their findings. Planning staff “concurs with the Findings of Effect letter prepared by the National Park Service which determined the proposed project will not have a significant impact on the subject property or the Port of San Francisco Embarcadero Historic District and will be in conformance with the Secretary of the Interior’s Standards for Rehabilitation.”²⁷

For these reasons, the proposed project’s impacts on historic resources, including the Embarcadero National Historic District and the Forts Baker, Barry, and Cronkhite National Historic District, would be considered less than significant.

Impact CR-2: The proposed project could potentially result in a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5. (Less than Significant with Mitigation)

Archaeological resources are defined as those that: 1) are significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military or cultural annals of California; 2) meet the criteria for listing on the California Register; or 3) are defined as a unique archaeological

²⁵ Muldoon, Cicely, U.S. Department of the Interior, National Park Service, Golden Gate Recreation Area, Acting General Superintendent, letter correspondence regarding “Alcatraz Ferry Embarkation Project, Golden Gate National Recreation Area” with Julianne Polanco, State Historic Preservation Officer, Office of Historic Preservation, June 23, 2017.

²⁶ Polanco, Julianne, State Historic Preservation Officer, Office of Historic Preservation, letter correspondence regarding “Alcatraz Ferry Embarkation Project, Golden Gate National Recreation Area” with Cicely Muldoon, U.S. Department of the Interior, National Park Service, Golden Gate Recreation Area, Acting General Superintendent, August 10, 2017.

²⁷ San Francisco Planning Department, Historic Resource Evaluation Response, Pier 31 ½ and Pier 33, Case No. 2017-001888ENV, August 31, 2017.

resource.²⁸ Determining the potential for encountering archaeological resources includes relevant factors such as the location, depth, and amount of excavation proposed, as well as any recorded information on known resources in the area. Ground disturbance would occur in the following areas for the proposed project: in-water at Pier 31½, where 12 new hollow steel piles would be driven; and at Fort Baker, where eight hollow steel piles would be driven at the Mine Wharf and a gravel trail would be constructed in the upland area between the wharf and the Discovery Museum parking area.

Two archaeological sites are recorded in the study area. Because the Area of Potential Effect includes the entire Port of San Francisco Embarcadero Historic District, it includes archaeological site CA-SFR-127H, the mid-Embarcadero Historic Fill site, which is an element of the historic district. However, SFR-127H is 0.65 mile southeast of the project area, and ground disturbance for the proposed project would not occur in the vicinity. The designation CA-MRN-648 has been assigned to a group of 55 structures and archaeological sites in east Fort Baker. Some features are also part of the Forts Baker, Barry, and Cronkhite National Historic District. Many of the archaeological features have not been evaluated for National Register of Historic Places eligibility, and some are likely not associated with the period of significance of Fort Baker.

No archaeological resources have been identified in-water at Pier 31½ or Fort Baker. Both areas are working waterfronts that have been subject to ongoing disturbance of the bay floor as the result of propeller wash, in addition to currents and seismic movement of the sea floor documented in the San Francisco Bay area.²⁹ A 1998 dive survey near the Mine Wharf at Fort Baker noted only sport fishing and crabbing equipment, as well as broken concrete piles, which are evidence of previous disturbance.³⁰ Installation of hollow core pilings would not likely encounter any significant, undisturbed archaeological historical resources at either location and would not bring soil to the surface for archaeological inspection. In the upland area of Fort Baker, the gravel trail would extend from the existing road to the Discovery Center. An archaeological survey has been previously conducted in the area,³¹ and no features of site CA-MRN-648 or any other archaeological resources were identified along the proposed trail route. Disturbance along the trail route, currently landscaped as lawn, would be surficial and would not be expected to extend into previously undisturbed soils.

²⁸ A unique archaeological resource is one where “without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria: 1) contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information; 2) has a special and particular quality such as being the oldest of its type or the best available example of its type; or 3) is directly associated with a scientifically recognized important prehistoric or historic event or person.” (California Public Resources Code § 21083.2 [g])

²⁹ Marine Design Associates, *Inspection of Fort Baker, Fort Point, and Fort Mason Pier 4, San Francisco, California*, 1998. Report on file at Golden Gate National Recreation Area, San Francisco, California.

³⁰ Ibid.

³¹ Stewart, Suzanne, Jack Meyer, and Michael Newland, *Phase One Investigations for the Fort Baker Archaeological Survey, Golden Gate National Recreation Area, Marin County, California*, 2001. Report on file at the Northwest Information Center, Sonoma State University, Rohnert Park, California.

Based on the above analysis, there is a low potential for uncovering archaeological resources during project construction. The proposed project operation is expected to have no impact on archaeological resources. While unlikely, it is possible that previously unrecorded and buried (or otherwise obscured) archaeological deposits could be discovered during ground disturbing activities. Excavating, grading, and moving heavy construction vehicles and equipment could expose and have impacts on unknown archaeological resources, which would be a significant impact. However, this impact would be reduced to a less-than-significant level with implementation of **Mitigation Measure M-CR-2, Accidental Discovery of Archaeological Resources**. This measure requires that archaeological resources be avoided, and if accidentally discovered, that they be appropriately assessed and treated.

Mitigation Measure M-CR-2: Accidental Discovery of Archaeological Resources

The following mitigation measure is required to avoid any potential adverse effect from the proposed project on accidentally discovered buried or submerged historical resources as defined in CEQA Guidelines Section 15064.5(a) and (c). The project proponent shall distribute the Planning Department archaeological resource "ALERT" sheet to the project prime contractor; any project subcontractor (including demolition, excavation, grading, foundation, pile driving, etc. firms); and any utilities firm involved in soil-disturbing activities within the project site. Prior to any soils disturbing activities being undertaken each contractor is responsible for ensuring that the "ALERT" sheet is circulated to all field personnel including, machine operators, field crew, pile drivers, supervisory personnel, etc. The project proponent shall provide the Environmental Review Officer and the Port of San Francisco with a signed affidavit from the responsible parties (prime contractor, subcontractor(s), and utilities firm) to the Environmental Review Officer confirming that all field personnel have received copies of the "ALERT" Sheet.

Should any indication of an archaeological resource be encountered during any soils disturbing activity of the project, the project Head Foreman and/or project proponent shall immediately notify the Environmental Review Officer and the Port of San Francisco and shall immediately suspend any soils disturbing activities in the vicinity of the discovery until the Environmental Review Officer has determined what additional measures should be undertaken.

If the Environmental Review Officer determines that an archaeological resource may be present within the project site, the project proponent shall retain the services of an archaeological consultant from the pool of qualified archaeological consultants maintained by the Planning Department archaeologist. The archaeological consultant shall advise the Environmental Review Officer and the Port of San Francisco as to whether the discovery is an archaeological resource, retains sufficient integrity, and is of potential scientific/historical/cultural significance. If an archaeological resource is present, the archaeological consultant shall identify and evaluate the archaeological resource. The archaeological consultant shall make a recommendation as to what action, if any, is warranted. Based on this information, the Environmental Review Officer may require, if warranted, specific additional measures to be implemented by the project proponent.

Measures might include: preservation in situ of the archaeological resource; an archaeological monitoring program; or an archaeological testing program. If an archaeological monitoring program or archaeological testing program is required, it shall be consistent with the Environmental Planning division guidelines for such programs. The Environmental Review Officer may also require that the project proponent immediately implement a site security program if the archaeological resource is at risk from vandalism, looting, or other damaging actions.

The project archaeological consultant shall submit a Final Archaeological Resources Report to the Environmental Review Officer and the Port of San Francisco that evaluates the historical significance of any discovered archaeological resource and describes the archaeological and historical research methods employed in the archaeological monitoring/data recovery program(s) undertaken. Information that may put at risk any archaeological resource shall be provided in a separate removable insert within the final report.

Copies of the Draft Final Archaeological Resources Report shall be sent to the Environmental Review Officer for review and approval. Once approved by the Environmental Review Officer, copies of the Final Archaeological Resources Report shall be distributed as follows: the California Archaeological Site Survey Northwest Information Center shall receive one copy, and the Environmental Review Officer shall receive a copy of the transmittal of the Final Archaeological Resources Report to the Northwest Information Center. The Environmental Planning division of the Planning Department shall receive one bound copy; one unbound copy; and one unlocked, searchable PDF copy on CD of the Final Archaeological Resources Report, along with copies of any formal site recordation forms (CA DPR 523 series) and/or documentation for nomination to the National Register of Historic Places/California Register of Historical Resources. In instances of high public interest or interpretive value, the Environmental Review Officer may require a different final report content, format, and distribution than that presented above.

With implementation of **Mitigation Measure M-CR-2, Accidental Discovery of Archaeological Resources**, as described above, the proposed project would have a less-than-significant impact on archaeological resources.

Impact CR-3: The proposed project could potentially disturb human remains, including those interred outside of formal cemeteries. (Less than Significant)

No burials or formal cemeteries have been identified near the area of ground disturbance for the proposed project. Human remains would not be expected in a near-shore, in-water environment; installation of pilings at Fort Baker and Pier 31½ is not expected to encounter human remains. At the proposed trail location at Fort Baker, the landform has been modified and disturbed in the historic era to the full extent of proposed ground disturbance for the trail. The proposed project is not expected to encounter or disturb human remains. Therefore, this impact would be less than significant.

Impact CR-4: The proposed project could potentially result in a substantial adverse change in the significance of a tribal cultural resource as defined in Public Resources Code §21074. (Less than Significant with Mitigation)

CEQA Section 21074.2 requires the lead agency to consider the effects of a project on tribal cultural resources. As defined in Section 21074, tribal cultural resources are sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are listed, or determined to be eligible for listing, on the national, state, or local register of historical resources. Based on discussions with Native American tribal representatives, in San Francisco, prehistoric archaeological resources are presumed to be potential tribal cultural resources. A tribal cultural resource is adversely affected when a project causes a substantial adverse change in the resource's significance. Pursuant to CEQA Section 21080.3.1(d), within 14 days of a determination that an application for a project is complete or a decision by a public agency to undertake a project, the Lead Agency is required to contact the Native American tribes that are culturally or traditionally affiliated with the geographic area in which the proposed project is located. Notified tribes have 30 days to request consultation with the Lead Agency to discuss potential impacts on tribal cultural resources and measures for addressing those impacts. On August 15, 2017, the Planning Department contacted Native American individuals and organizations in the San Francisco area, providing a description of the proposed project and requesting comments on the identification, presence, and significance of tribal cultural resources in the project vicinity. No tribes provided information or requested consultation.

As discussed under Impact CR-2 and Impact CR-3, no archaeological resources or human remains have been identified in the project area, and it is not anticipated that any would be encountered because of the small scale and shallow depth of anticipated ground disturbance. The proposed project is not anticipated to have impacts to archaeological resources or human remains. However, in the unlikely event that archaeological resources or human remains are encountered, they could be identified as tribal cultural resources at the time of discovery or at a later date. Therefore, the potential adverse effects of the proposed project on previously unidentified archaeological resources, discussed under Impact CR-2, also represent a potentially significant impact on tribal cultural resources. Implementation of **Mitigation Measure M-CR-4, Tribal Cultural Resources Interpretive Program**, would reduce potential adverse effects on tribal cultural resources to a less-than-significant level. **Mitigation Measure M-CR-4, Tribal Cultural Resources Interpretive Program**, would require either preservation-in-place of the tribal cultural resources, if determined effective and feasible, or an interpretive program regarding the tribal cultural resources developed in consultation with affiliated Native American tribal representatives.

Mitigation Measure M-CR-4: Tribal Cultural Resources Interpretive Program

If the Environmental Review Officer determines that a significant archaeological resource is present, and if in consultation with the affiliated Native American tribal representatives, the Environmental Review Officer determines that the resource constitutes a tribal cultural resource and that the resource could be adversely affected by the proposed project, the proposed project

shall be redesigned so as to avoid any adverse effect on the significant tribal cultural resource, if feasible. If the Environmental Review Officer, in consultation with the affiliated Native American tribal representatives and the project proponent, determines that preservation-in-place of the tribal cultural resources is not a sufficient or feasible option, the project proponent shall implement an interpretive program of the tribal cultural resources in consultation with affiliated tribal representatives. An interpretive plan produced in consultation with the Environmental Review Officer and affiliated tribal representatives, at a minimum, and approved by the Environmental Review Officer, would be required to guide the interpretive program. The plan shall identify, as appropriate, proposed locations for installations or displays, the proposed content and materials of those displays or installation, the producers or artists of the displays or installation, and a long-term maintenance program. The interpretive program may include artist installations, preferably by local Native American artists, oral histories with local Native Americans, artifacts displays and interpretation, and educational panels or other informational displays. In the event that construction activities disturb unknown archaeological sites that are considered tribal cultural resources, any inadvertent damage would be considered a significant impact.

With implementation of **Mitigation Measures M-CR-2, Accidental Discovery of Archaeological Resources**, and **M-CR-4, Tribal Cultural Resources Interpretive Program**, as described above, the proposed project would have a less-than-significant impact on previously unknown tribal cultural resources.

Impact C-CR: The proposed project, in combination with past, present, and reasonably foreseeable future projects in the vicinity, could potentially result in cumulative impacts to cultural resources. (Less than Significant with Mitigation)

The geographic scope of potential cumulative impacts on historic built environment resources encompasses the entirety of the Port of San Francisco Embarcadero National Historic District and the Fort Baker portion of the Forts Baker, Barry, and Cronkhite National Historic District. Cumulative projects in the Embarcadero National Historic District, such as Pier 29 reconstruction, the Pier 43½ Golden Gate Scenic Steamship project, and the Downtown Ferry Terminal Expansion, are not anticipated to cause or contribute to impacts on the historical resource, as these projects would not alter the physical characteristics that convey the district's historical significance. No cumulative projects are identified in the Fort Baker portion of the Forts Baker, Barry, and Cronkhite National Historic District. Accordingly, the proposed project, together with the cumulative development, would have a less-than-significant impact on historic built environment resources.

The geographic scope of potential cumulative impacts on archaeological resources, human remains, and tribal cultural resources encompasses the project site and nearby vicinities. All cumulative projects identified in the proposed project vicinity (see Table 6) are assumed to cause some degree of ground disturbance during construction and thus contribute to a potential cumulative impact on cultural resources.

Background research suggests that the potential to encounter archaeological resources, tribal cultural resources, or human remains would be low; however, the proposed project would have the potential to affect unknown resources should they be present in the project area. In combination with the other identified cumulative projects, the potential for a cumulative impact would be significant without mitigation. With implementation of **Mitigation Measures M-CR-2, Accidental Discovery of Archaeological Resources**, and **M-CR-4, Tribal Cultural Resources Interpretive Program**, the proposed project's contribution to cumulative impacts on archaeological resources, tribal cultural resources, and human remains would be less-than-cumulatively considerable with mitigation (less than significant with mitigation).

<i>Topics:</i>	<i>Potentially Significant Impact</i>	<i>Less Than Significant with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>	<i>Not Applicable</i>
5. TRANSPORTATION AND CIRCULATION— Would the project:					
a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Conflict with an applicable congestion management program, including but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Result in inadequate emergency access?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

The proposed project is not located within an airport land use plan area or in the vicinity of a private airstrip. Therefore, Topic E.5(c) is not applicable to the proposed project. A transportation study was prepared for the proposed project, which was based in part on the 2013 traffic analysis included in the

Park Service's EIS prepared for the proposed project and updated for current conditions. The following analysis is based on the information provided in the transportation memorandum.³² Additional analysis regarding transportation and circulation at Fort Baker and Sausalito is provided in Appendix B based on a supplemental transportation study.³³

Setting

Pier 31½

The proposed project site at Pier 31½ is located on the eastern side of The Embarcadero, bounded by Pier 31 to the south, Pier 33 to the north, and the San Francisco Bay to the east. The Embarcadero, adjacent to the Pier 31½ site, consists of three northbound and two southbound travel lanes, one historic streetcar line in each direction (in the median), northbound and southbound class II bikes lanes, a standard sidewalk on the southbound side, and a multi-use promenade on the northbound side.

The Pier 31½ site opens onto the multi-use promenade, which runs the length of The Embarcadero from Fisherman's Wharf to the AT&T Ballpark. Pedestrians may cross to the promenade directly across from the site at the Bay Street and The Embarcadero intersection or south of the site at the Sansome Street/Chestnut Street and The Embarcadero intersection. In addition to providing pedestrian crossings, these are the two closest vehicle intersections to the site.

Bay Street is a two-way, east-west roadway that connects the site to the North Beach, Russian Hill, and Marina Districts. Chestnut Street and Sansome Street form a "K" intersection with The Embarcadero. Chestnut is a one-way, two-lane street, which directs traffic east, away from The Embarcadero to a dead-end, two blocks away. Sansome is also a one-way, two-lane, northbound street. Although closer to the Bay Street intersection, the proposed project site at Pier 31½ is within reasonable walking distance from either intersection.

Roadway connectivity to San Francisco's interior is limited along this stretch of The Embarcadero, given the topographical barrier created by Telegraph Hill a few blocks southwest of the site. This barrier means that most visitors would travel to the site from either the north or the south, with Bay Street serving as the prominent east-west access option. Employees and select shuttle companies are permitted to either park or pick-up/drop-off in the interior of the site, but all other visitors arriving by car must park at an off-site location and walk. Tour bus parking is provided in front of the Pier 33 bulkhead building.

Transit Network

Table 8 presents the transit options near the Pier 31½ site. Primary public transit access to the site is provided by San Francisco Municipal Railway (Muni) bus and streetcar services. The Historic F Market/Wharf and E Embarcadero streetcars operate in their own right-of-way in the median on The

³² Fehr & Peers, *Alcatraz Embarkation Facility – Pier 31½ Circulation Study*, San Francisco, CA, December 2017.

³³ Fehr & Peers, *Alcatraz Embarkation Facility – Pier 31½ Circulation Study, Response to PMND Appeal Transportation Concerns*, February 8, 2018.

Embarcadero, following signals that are timed with north- and south-bound traffic. Muni bus lines with service near the site include 82X Levi Express, 8/8X Bayshore Express, 39 Coit Tower and 47 Van Ness. Various ferry service providers operate out of Pier 41 about a quarter-mile north on The Embarcadero. According to the Transportation Study, all ferries from Pier 41 run to the Ferry Building, Alameda, and Oakland during the mid-day on weekdays and all day on the weekends.³⁴

TABLE 8
TRANSIT ROUTES, STOPS, AND FREQUENCIES NEAR PIER 31½

Route	Destination(s)	Nearest Stop Location	Service Frequency (minutes)			
			AM	Midday	PM	Saturday
Muni Transit Service						
F Market & Wharves	The Embarcadero, Market Street, Upper Market	Embarcadero/Bay	8	7	7	8
E Embarcadero	4 th Street/King Street, Ferry Building, Fisherman’s Wharf	Embarcadero/Bay	--	20	16	16
8/8BX Bayshore Express	Balboa Park, Financial District, North Beach	Kearny/North Point	6/6	7/--	7/7	8/--
39 Coit Tower	Coit Tower, Fisherman’s Wharf, North Beach	Stockton/North Point	--	20	20	20
47 Van Ness	Fisherman’s Wharf, Soma	Powell/Beach	8	9	8	10

Water Emergency Transport Authority (WETA)/SF Bay Ferry & Blue and Gold Fleet						
Various Ferry Lines	Alameda, Oakland, SF Ferry Building	Pier 41	--	45+	--	45+
Golden Gate Transit						
Various GG Bus Lines ¹	Financial District, Van Ness, Embarcadero	Embarcadero/Bay	30	45	30	--

1. Although Golden Gate Transit buses travel near Pier 31½, Golden Gate Transit vehicles are prohibited from picking passengers up in San Francisco in the inbound direction and from dropping passengers off in San Francisco in the outbound direction. Because of this, Golden Gate Transit is not expected to be a key transit connection to the proposed project. Headways shown are the average of 13 Golden Gate Transit routes that stop at Bay Street and Embarcadero.

Source: Fehr & Peers, *Alcatraz Embarkation Facility – Pier 31½ Circulation Study*, San Francisco, California, September 2017.

According to the Transportation Study, all transit lines operate within their capacity utilization threshold in the AM peak hour, and all lines except the F-Market & Wharves operate within the capacity utilization threshold in the PM peak hour. In the PM peak hour, the F-Market & Wharves exceeds the capacity utilization threshold in the PM peak hour in the outbound direction.

Pedestrian and Bicycle Facilities

Existing pedestrian facilities within the vicinity of the Pier 31½ site include sidewalks, crosswalks, curb ramps, pedestrian signals, and streetscape and landscape features (i.e., trees, planters, and street lighting). The multi-use promenade along the east side of The Embarcadero is generally 18 to 25 feet wide.

³⁴ Fehr & Peers, *Alcatraz Embarkation Facility – Pier 31½ Circulation Study*, San Francisco, CA, September 2017.

Sidewalks on the west side of The Embarcadero are generally 10 feet wide. Pedestrians can cross The Embarcadero at either Bay Street, which is approximately 350 feet north of the Pier 31½ site, or Chestnut Street/Sansome Street, which is 700 feet to the south. Most active uses on The Embarcadero are located on the waterfront (east side) where the majority of pedestrian activity occurs.

Existing pedestrian volumes and conditions were evaluated during field visits to the Pier 31½ site. Less pedestrian activity was observed along The Embarcadero's west side in comparison to activity on the east side promenade. Approximately 150 and 250 people crossed Bay Street during the AM and PM peak hours, respectively. Similar volumes crossed Chestnut Street during the AM and PM peak hours, with 340 crossing Sansome Street in the PM peak hour. The Embarcadero crossing at Bay Street had about 80 more pedestrian crossings in the AM peak hour than The Embarcadero crossing at Sansome, but PM peak hour crossing volumes were about the same (approximately 200) for the two intersections. According to the Transportation Study, although pedestrian volumes are high, pedestrian facilities operate within acceptable crowding levels.

Existing bicycle facilities are part of the City of San Francisco bicycle network. Bikeways are typically classified into three categories:

- **Class I:** Pathways that provide exclusive right-of-way for use by bicyclists and pedestrians.
- **Class II:** Bicycle lanes striped within the roadway for use by bicyclists, typically between the vehicle travel lane and parking lane or curb.
- **Class III:** Bicycle routes that are signed and sometimes marked with shared lane markings ("sharrows") where bicycles and vehicles share the same travel lane.

The Pier 31½ site is served by several primary bicycle facilities. A Class II facility runs along The Embarcadero between North Point Street and AT&T Park in the South of Market Area (Soma), including in front of the site and southbound on the other side of The Embarcadero. The eastern promenade of The Embarcadero is designated as Herb Caen Way, a Class I shared bicycle/pedestrian path. Finally, a Class II facility runs along North Point Street between The Embarcadero and Van Ness Avenue through Fisherman's Wharf.

Bicycle parking on the project site is provided in two locations: two large public racks placed on the side of the Pier 33 building; and two large employee racks in the Pier 31 building (inside the enclosed employee parking area). These parking racks were about 90% full during the June 27, 2017, observation site visit conducted for the transportation study, each accommodating anywhere from 10 to 15 bikes at a time. There are seven public u-racks in front of Pier 35 and Pier 33 (within 500 feet of Pier 31½). None of these racks were in use during either site observation period (mid-day and PM). There are also three pedicab stops located along the curb in front of Pier 31½.

During the site observation period, about 210 cyclists were counted traveling northbound (directly in front of the Pier 31½ site) on The Embarcadero in the PM peak hour, while about 100 were counted traveling in the southbound direction. The higher volume of northbound cyclists led to more conflicts

between cyclists and pedestrian loading activities. Most of the northbound cyclists in the PM period were observed to be commuter rather than tourist cyclists, which were more common during the mid-day period. Commuting cyclists typically moved at a quicker speed than tourist cyclists and opted to merge into a travel lane to avoid idling curb activity rather than come to a stop in the bike lane. The summer 2017 expansion of Ford GoBike's regional bikeshare program included a station just south of the Pier 31½ site at The Embarcadero/Sansome Street/Chestnut Street intersection. The station, which has 14 bike docks, is the northernmost station planned at the time of the Transportation Study, with the next closest station located at The Exploratorium at Pier 15.

Parking Conditions

Off-street parking is currently provided on the Pier 31½ site for Park Service and site staff, and is not provided for visitors. There is space for about 15 cars in the on-site parking area on the southeast portion of the site, 12 of which were observed to be occupied at mid-day on a weekday. The informal gate entrance off The Embarcadero northbound is opened and closed by the security guard/information officer for the site. When exiting the site, cars must turn right onto The Embarcadero northbound. Conflicts were not observed between pedestrians and vehicles entering and exiting the parking lot on the day of the site visit; in a few instances, the guard directed pedestrian traffic in order to let a car enter or exit.

There are approximately 1,125 off-street parking spaces in garages and lots within a quarter-mile of the Pier 31½ site. The parking garages in the area are privately-owned, but available to the public. Surface parking in the area is generally managed by the Port of San Francisco, and only represents a small portion of the total off-street parking count. Within a quarter-mile of the site, there are approximately 690 on-street parking spaces. This count includes spaces to the northeast of Telegraph Hill but does not include spaces within a quarter-mile that would require a circuitous route to the site due to topography or discontinuous streets.

Parking is most utilized between 12:00 PM and 3:00 PM during weekdays when, on average, 80 percent of available on-street spaces are occupied. Off-street parking garages are between 50 and 70 percent occupied during business hours (generally 9:00 AM to 6:00 PM), and after 6:00 PM, parking utilization drops to 26 percent. On-street parking in the area is also effectively full between 9:00 AM and 6:00 PM, when utilization is between 80 and 100 percent. Weekend parking utilization is around 50 percent, reflecting the ability to find available parking easily.

Passenger Loading

Field observations were conducted at the Pier 31½ site on a typical weekday during mid-day and PM peak periods while Alcatraz ferry trips were operating. Most passenger loading activity occurred immediately in front of the site, but activity related to the site extended as far north as Pier 35 and as far south as Pier 31. The only existing loading zone near the site is immediately north of the Bay Street intersection, which is in front of the Pier 33 Bulkhead building, approximately 400 feet north of the site entrance. The loading zone (approximately 45 feet long) can accommodate one bus or two cars comfortably. All other curb space between Pier 31 and 35 is dedicated to driveways or metered on-street

parking, which includes one Americans with Disabilities Act-accessible space immediately in front of the site entrance. In addition to vehicle parking spaces, there are two curb spaces designated for pedicabs. These pedicab spaces flank the Americans with Disabilities Act space immediately in front of the site entrance. There is an additional pedicab zone on the promenade sidewalk in front of the site. South of the site driveway is a stretch of red curb extending to the Pier 31 driveway, which is signed as “No stopping anytime.”

The majority of pick-ups and drop-offs were performed by either a TNC vehicle (e.g., Uber or Lyft) or taxi (59 percent of all stops). The highest passenger loads came from tour buses (20 percent of stops). Private vehicles also accounted for 18 percent of stops. Shuttles and freight (remaining 3 percent of stops) appeared a few times during site observations, but played a minor role when compared to other vehicle categories.³⁵

Despite the curb restrictions, most curb activity occurred immediately in front of the Pier 31½ site, likely due to the door-to-door nature of TNCs and taxis. This led to numerous conflicts with bicycles and automobiles while cars were parked or idling in the bicycle and/or travel lanes. Only on rare occasions did vehicles pull fully into an empty curb parking space. Tour buses typically drove past the site and used the designated loading zone on The Embarcadero north of Bay Street (Figure 14). In the event that two buses arrived at the loading zone simultaneously, however, the second bus was forced to stack in the bicycle lane. As shown in Figure 15, vehicles dropping off and picking up visitors most commonly utilized the area directly fronting the site. This area included the Americans with Disabilities Act parking space (when unoccupied), the tapered curb area, and pedicab zone north of the site driveway, the site driveway, and the red curb zone south of the site.

Pedicab Activity

Pedicabs—typically in the form of a bicycle pulling a two- to three-passenger bench on wheels—are a unique mode of transport along The Embarcadero. They typically travel in the bicycle lane, but pull up onto the promenade to load and unload passengers. Three staging zones are designated for the pedicabs adjacent to the Pier 31½ site: two on the street and one large box marked on the promenade itself. Pedicab drivers were diligent in staying in these boxes while trying to attract passengers. The existing Alcatraz ferry embarkation site was noted to be a popular staging area for the pedicabs drivers, who would often return to the site after dropping passengers off elsewhere along The Embarcadero. The pedicab drivers were observed to be particularly successful at attracting disembarking ferry passengers in the early PM period (4:00 PM to 5:00 PM) and would typically carry two to three passengers. Although pedicab counts were not recorded, pick-up and drop-off volumes appeared higher than private vehicle activity but lower than TNC and taxi activity, and were noted to be an important factor in the passenger loading activity for the site.

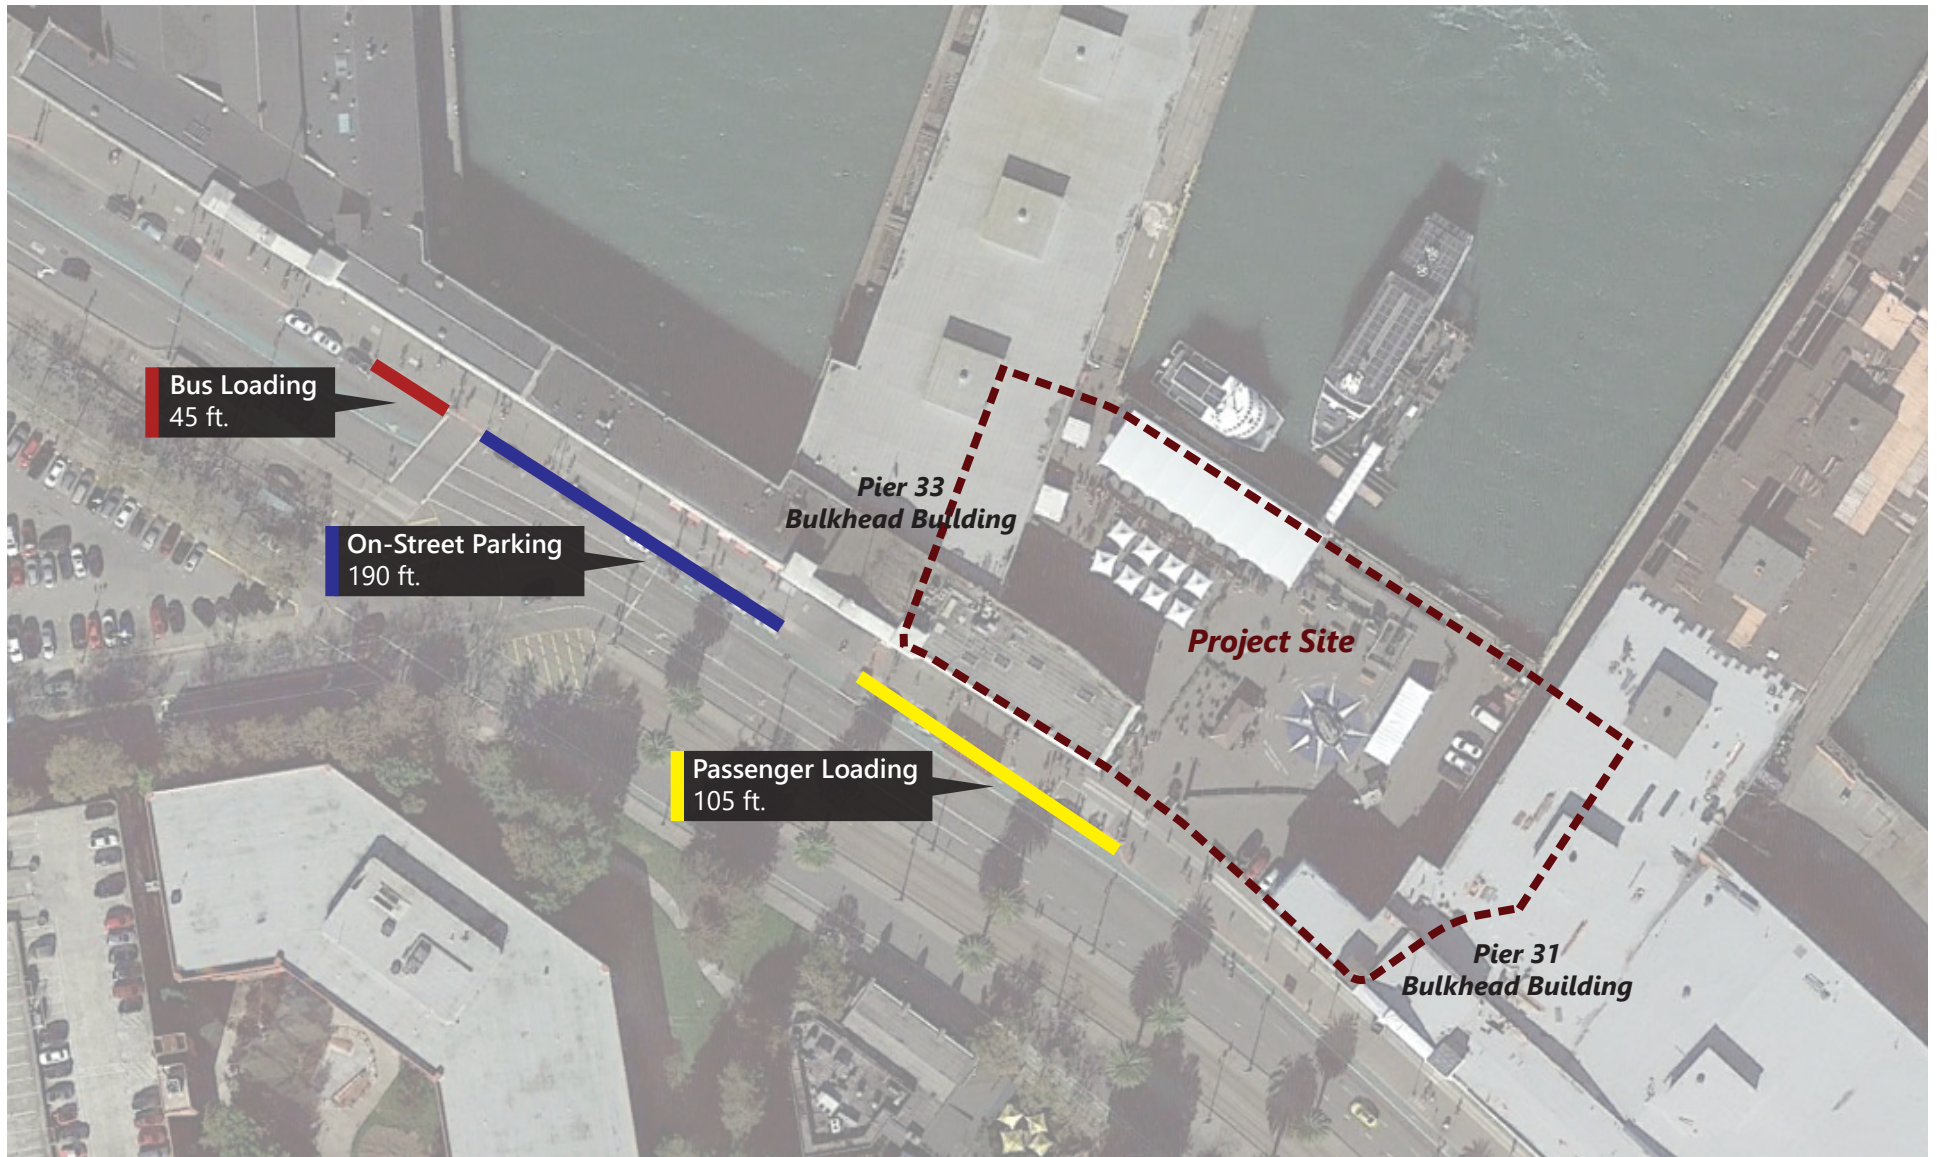

³⁵ More shuttles visited the site to load or unload passengers than were recorded in the curb activity log. This is due to the fact that certain shuttle companies were permitted to enter the on-site parking lot via the site driveway.

Commercial/Freight Loading

Commercial loading at the Pier 31½ site occurs primarily in the on-site parking area. However, at the time of site observations, two commercial loading instances occurred. In the first instance, the truck parked in the bike lane and remained there for approximately 15 minutes. The second truck found an open parking spot along the curb and pulled fully out of the bike lane; it remained in the spot for 20 minutes. It was unclear whether either of these deliveries were received by the Pier 31½ site or some other neighboring business. Fuel loading for the ferries occurs in the pedestrian plaza after hours when there are no pedestrians in the plaza and pedestrian activity is low on the sidewalk. Waste and recycling collection for facility occurs in the Pier 33 shed building in the early morning.

Emergency Services and Access

Emergency vehicles typically use The Embarcadero northbound to access the Pier 31½ site. As an arterial roadway, The Embarcadero allows emergency vehicles to travel at higher speeds and permits other traffic to maneuver out of the path of the emergency vehicle. Further, in cases of heavy congestion, emergency vehicles could use the center transit-only lanes used by the F-Market and Wharves and the E-Embarcadero streetcars. The San Francisco Fire Department stations closest to the Pier 31½ site are Station 28 (1814 Stockton Street at Greenwich Street, 0.6 mile away from the site) and Station 13 (530 Sansome Street at Washington Street, 0.8 mile away from the site).

Fort Baker

Fort Baker is a 335-acre federal park located immediately north of the Golden Gate Bridge. The park consists of historic buildings clustered around a main parade ground, a sheltered harbor protected by a jetty, and trails and forested areas. As discussed in Section A, Project Description, the ferry service would operate on a limited basis on weekends only and the concessioner would not be permitted to sell tickets at Fort Baker. All trips would be roundtrip, departing from and returning to the Pier 31½ site. There would be no alterations of the existing parking near the pier, and no shuttle service would be provided to serve ferry passengers. The proposed project would not result in change to roadways or visitors accessing the park by auto, transit, or bicycle. Therefore, the setting discussion is limited to the pedestrian resources.

High-visibility pedestrian amenities exist surrounding the Bay Area Discovery Museum parking lot, loading zone, and entrance. All sidewalks around the parking lot have multiple ramp access points with warning pads, and brightly striped crosswalks form clear pedestrian pathways through the parking lanes to the museum entrance. These elements continue into the gravel parking area at the southern end of the lot.

A paved, separated pathway travels the length of the Parade Grounds along Center Road and provides a travel route to the pier and waterfront from either the Cavallo Point facilities or the museum. The paved pathway continues around the southern edge of the Parade Grounds, but does not connect to the pier. The pedestrian connection between the pier and Center Road requires crossing grass, an unmarked intersection, and walking along the road. An informal dirt path exists along the east side of Moore Road between Center Road and Sommerville Road.

Existing pedestrian infrastructure and pathways at Fort Baker were assessed on July 12, 2017, between 9:00 AM and 11:00 AM. Conditions were observed on Center Road, Moore Road, the pier, Sommerville Road, Murray Circle, East Road, and around the Bay Area Discovery Museum and parking lot. During observations, there was a steady, but low-volume flow of vehicles into and out of the museum parking lot. This was likely due to summer camp loading and unloading. There was very little vehicle or pedestrian activity outside of the museum parking lot. Pedestrian activity outside of the museum parking lot was estimated at 15 to 20 visitors over the course of 2 hours.

Approach to Analysis

Policy 10.4 of the Transportation Element of the *General Plan* directs City decision-makers to “consider the transportation system performance measurements in all decisions for projects that affect the transportation system.” In order to determine whether the proposed project would conflict with a transportation- or circulation-related plan, ordinance, or policy, this section discusses the potential impacts that the proposed project could have on traffic, transit, pedestrian, bicycle, and emergency vehicle circulation, as well as potential impacts associated with loading activities and construction activities.

Vehicle Miles Traveled in San Francisco and the Bay Area

Many factors affect travel behavior. These factors include density, diversity of land uses, design of the transportation network, access to regional destinations, distance to high-quality transit, development scale, demographics, and transportation demand management. Typically, low-density development at great distance from other land uses, located in areas with poor access to non-private vehicular modes of travel, generate more automobile travel compared to development located in urban areas, where a higher density, mix of land uses, and travel options other than private vehicles are available.

Given these travel behavior factors, San Francisco has a lower VMT ratio than the nine-county San Francisco Bay Area region. In addition, some areas of the City have lower VMT ratios than other areas of the City. These areas of the City can be expressed geographically through transportation analysis zones. Transportation analysis zones are used in transportation planning models for transportation analysis and other planning purposes. The zones vary in size from single city blocks in the downtown core, multiple blocks in outer neighborhoods, to even larger zones in historically industrial areas like the Hunters Point Shipyard.

The San Francisco County Transportation Authority uses the San Francisco Chained Activity Model Process (SF-CHAMP) to estimate VMT by private automobiles and taxis for different land use types. Travel behavior in SF-CHAMP is calibrated based on observed behavior from the California Household Travel Survey 2010-2012, Census data regarding automobile ownership rates and county-to-county worker flows, and observed vehicle counts and transit boardings. SF-CHAMP uses a synthetic population, which is a set of individual actors that represents the Bay Area's actual population, who make simulated travel decisions for a complete day. The Transportation Authority uses tour-based analysis for office and residential uses, which examines the entire chain of trips over the course of a day, not just trips to and from the project. For retail uses, the Transportation Authority uses trip-based analysis, which counts VMT from individual trips to and from the project (as opposed to entire chain of trips). A trip-based approach, as opposed to a tour-based approach, is necessary for retail projects because a tour is likely to consist of trips stopping in multiple locations, and the summarizing of tour VMT to each location would over-estimate VMT.^{36,37}

For the purposes of VMT analysis, retail VMT is used as a proxy for other similar developments (such as the tourist activity). For retail development, regional average daily work-related VMT per employee is 7.3. Table 9 includes the transportation analysis zone (TAZ) in which the proposed project site is located, TAZ 854.

³⁶ A tour-based assessment of VMT at a retail site would consider the VMT for all trips in the tour, for any tour with a stop at the retail site. If a single tour stops at two retail locations, for example, a coffee shop on the way to work and a restaurant on the way back home, then both retail locations would be allotted the total tour VMT. A trip-based approach allows us to apportion all retail-related VMT to retail sites without double-counting.

Travel Demand

Trip Generation

Daily and peak hour person trip generation forecasts for the proposed project sites at Pier 31½ and Fort Baker were developed based on the existing and expected visitors to the island and embarkation site. The existing Alcatraz ferry embarkation site currently has about 5,460 touring visitors (i.e., ticketed passengers taking the ferry to the island) and 700 non-touring visitors on a peak day of the year (i.e., visitors that travel to the embarkation site but do not board a ferry to Alcatraz Island). Typically, the non-touring visitors consist of visitors that do not have pre-purchased tickets and cannot be accommodated because ferries are sold out.

In general, visitation peak is controlled by the capacity of Alcatraz Island, and not necessarily the number of ferries that arrive and depart from the embarkation site. After planned long-term enhancements are made on-island to more efficiently manage visitor flow (not part of the proposed project), the Park Service expects that approximately 20 percent more visitors can be accommodated on a peak day (i.e., about 6,600 daily Alcatraz Island visitors). Similarly, the number of non-touring visitors is expected to increase in the long term, from approximately 700 to 800 per day.³⁸ Enhancements to landside facilities at the Pier 31½ embarkation site as part of the proposed project are expected to more comfortably accommodate the increased number of visitors, but they are not essential to the growth, which would occur with or without the enhancements to the embarkation facility.

Under the proposed project, the embarkation facility would contain an additional berth that would operate additional ferry service to Fort Baker as well as offer interpretive cruises around the bay. Ferry service to Fort Baker would be limited to two ferries per day and occur on weekends only. For the purposes of the transportation study, the Fort Baker ferry service was included in the weekday travel demand estimates in order to present a conservative “peak day” analysis. The peak day person trip generation under near-term and long-term conditions are summarized in Table 10.

Person trip generation for peak hours is driven largely by ferry departures and arrivals that occur during the peak hours, as well as the visitor arrival patterns discussed in the *Draft Embarkation Facility Space Planning Model-Results* study.³⁹ The study provided information on the typical visitor arrival time before a ferry leaves the dock, length of stay after disembarking from a ferry, and the number of non-island tour visitors expected to be at the site during a typical hour throughout the day. Much of the changes proposed by the proposed project are designed to better accommodate future increased levels of visitation that will occur regardless of the proposed project. Thus, travel demand associated with increases in visitorship to Alcatraz Island is not considered part of the proposed project. The existing and future peak hour person trips to the primary Alcatraz ferry embarkation site are presented in Table 11.

³⁹ORCA, *Draft Embarkation Facility Space Planning Model-Results*, 2011.

Mode split was based on a large survey effort conducted by Fehr & Peers in July 2012. The response rate was very high, with over 800 completed surveys at Pier 31½. Mode of travel was recorded in the survey and presents a robust mode split that was applied proportionally to the existing trip generation as well as the 6 percent predicted increase in visitors (see Table 10). The resulting net new trips and total person trips are shown in Table 12. To convert person trips to vehicle trips, an average vehicle occupancy of 3.9 was derived from the survey data and applied to the Taxi and Car+Walk modes. For tour buses, an average vehicle occupancy of 40 was assumed, based on the split between full size tour buses and smaller shuttle-style buses. The net new and total vehicle trips is presented in Table 13.

1. In order to convert person trips to vehicle trips, the following occupancy assumptions were made: for tour buses, it was assumed that all tour buses were full, for an average occupancy of 40 visitors. For car and taxi arrivals, an average vehicle occupancy of 3.9 was used, which was derived from the survey effort results.
2. New trips would be accommodated by existing buses.

Source: Fehr & Peers, *Alcatraz Embarkation Facility – Pier 31½ Circulation Study*, San Francisco, CA, December 2017.

Impact TR-1: The proposed project would not cause substantial additional Vehicle Miles Traveled or substantially induce automobile travel. (Less than Significant)

Vehicle Miles Traveled Analysis

As mentioned previously, existing average daily VMT per employee for retail uses in TAZ 854 is 7.9 miles. This is 47 percent below the existing regional average daily VMT per capita of 14.9. Given that the project site is located in an area where existing VMT is more than 15 percent below the existing regional average, the proposed project's bar/lounge use would meet the Map-Based Screening for Retail and Residential Projects criterion and would not result in substantial additional VMT, and impacts would be less than significant. The project site also meets the Proximity to Transit Stations screening criterion, which indicates that the proposed project's retail uses would not cause substantial additional VMT.

The proposed project would generate 10 net new PM peak-hour vehicle trips that would travel through surrounding intersections. These 10 PM peak-hour vehicle trips represent a small portion of the overall number of PM peak-hour vehicle trips that pass through the Embarcadero and nearby roadways. The proposed project's daily and PM peak-hour vehicle trips would not substantially increase traffic volumes at nearby intersections such that new traffic hazards would be created.

The State Office of Planning and Research's proposed transportation impact guidelines include a list of transportation project types that would not likely lead to a substantial or measurable increase in VMT. As a transit project, the proposed Fort Baker ferry service would not result in a substantial increase in VMT.

For these reasons, the proposed project would result in less-than-significant traffic impacts, and no mitigation measures are necessary.

Impact TR-2: The proposed project would not conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system and would not conflict with an applicable congestion management program. (Less than Significant)

Construction Impacts

Prior to construction, the project proponent and construction contractor(s) would be required to meet with Public Works and San Francisco Metropolitan Transportation Agency staff to develop and review truck routing plans for demolition, disposal of excavated materials, materials delivery and storage, and staging for construction vehicles. The construction contractor would be required to comply with the City of San Francisco's Regulations for Working in San Francisco Streets (the Blue Book), including those regarding sidewalk and lane closures, and would meet with San Francisco Metropolitan Transportation Agency staff to determine whether any special traffic permits would be required. In addition to the regulations in the Blue Book, the contractor would be responsible for complying with all city, state and federal codes, rules, and regulations.

Construction-related activities would generally occur Monday through Friday. Construction is not anticipated to occur on Saturdays, Sundays, or major legal holidays, but may occur as needed and if approved by the Port's Building Permit Group (a part of the Engineering Division). The hours of construction would be stipulated by the Building Permit Group, and the contractor would be required to comply with the San Francisco Noise Ordinance and the Blue Book, including requirements to avoid peak hour construction activities on adjacent streets.

All construction-related activity would enter the site from the project site driveway on The Embarcadero. Most trucks would approach the site from I-80 W or US-101 N, by using Embarcadero northbound. Trucks over 3 tons are restricted in much of the Marina and North Beach districts, including Bay Street from Laguna Street to Columbus Avenue. These restrictions make for a circuitous route from US-101 S that would discourage construction trucks from approaching the site from the north or west.

During construction of the proposed project, portions of Pier 31½ would be closed to visitors, although overall ferry service to Alcatraz Island is expected to remain open during the construction period. Closure of portions of Pier 31½ during construction may result in additional localized crowding for pedestrians, especially when ferries are loading and unloading.

At Fort Baker, all construction related activity is expected to be staged on the site itself and out of the roadway or pedestrian right-of-way. Most construction activity at the Fort Baker site would take place around the pier on barges and floats.

For the reasons noted above, the proposed project's construction impacts related to transportation would be less than significant.

Passenger Loading

Under existing conditions at Pier 31½, passenger loading on the Embarcadero northbound occurs primarily outside of the designated loading zone. Tour buses are the only vehicle type to consistently utilize the loading zone, while most other vehicle types (for-hire vehicles, private automobiles, and shuttles) queue in the pedicab parking spots, bicycle lane, or vehicle lane directly fronting the site, blocking pedicab, cyclist, and/or automobile travel.

The increase in maximum passenger loading demand due to the proposed project was estimated by scaling up the existing maximum passenger loading demand (15 and 9 vehicles in the peak 15-minutes in the mid-day and PM peak hours, respectively) by 6 percent, or the expected increase in daily visitors, as shown in Table 10. Each vehicle stopped for approximately 1 minute or less to load or unload passengers. Table 14 presents the existing maximum passenger loading demand and the estimated demand under the proposed project. As shown in Table 10, the proposed project would increase the number of visitors by 6 percent. Assuming additional visitors use modes of travel in the same proportion as under existing conditions, the peak loading demand in the mid-day peak hour would increase from 15 to 16 vehicles. The peak loading demand in the PM peak hour would increase from 9 to 10 vehicles. The proposed loading zone would be able to accommodate five to six vehicles at a time, which is two to three more vehicles than was ever observed loading simultaneously under existing conditions. For this reason, and given the very small increase in loading demand under the proposed project, it is anticipated that that new loading zone would be able to accommodate peak loading demand. Therefore, the impacts of the proposed project would be less than significant.

TABLE 14
PEAK 15-MINUTE PASSENGER LOADING ZONE ACTIVITY

	Existing	Net New Loading	Total
Mid-day Peak 15 minutes (11:00 AM – 11:15 PM) ¹	15	1	16
PM Peak 15 minutes (4:15 PM – 4:30 PM) ²	9	1 ³	10

1. The maximum passenger loading demand for the Mid-day peak hour currently occurs at 11:00 AM.

2. The maximum passenger loading demand for the PM peak hour currently occurs at 4:15 PM.

3. Vehicles are rounded to nearest whole number.

Source: Fehr & Peers, *Alcatraz Embarkation Facility – Pier 31½ Circulation Study*, San Francisco, CA, September 2017.

Because the proposed weekend ferry service to Fort Baker would only accommodate round-trip passengers ticketed at Pier 31½, all new visitors are anticipated to arrive via the ferry. The proposed project activities at Fort Baker involve no substantial changes to the roadway network and are not anticipated to generate any only a nominal number of new vehicle trips on the local roadways that may result if ferry passengers utilized a for-hire vehicle service, such as taxis, Uber or Lyft.⁴⁰ Pick-up or drop-

⁴⁰ Fehr & Peers, *Alcatraz Embarkation Facility – Pier 31½ Circulation Study, Response to PMND Appeal Transportation Concerns*, February 8, 2018. According to a conservative scenario analyzed in this study, if half of all ferry passengers travelled by vehicle outside Fort Baker, each ferry trip could result in approximately 30 vehicle trips.

off would likely be dispersed over the day and spread over multiple destinations within Fort Baker. Therefore, the vehicle and circulation impacts at the Fort Baker site could accommodate passenger loading demand and impacts and vicinity would also be less than significant.

Commercial Loading

At the Pier 31½ site, the proposed project would relocate commercial loading from the existing service parking lot on the marginal wharf to the interior of the Pier 31 and Pier 33 shed buildings, however, commercial loading demand would remain the same. Although the number of commercial vehicles may stay the same as today, they would be consolidated from three potential conflict points (driveways) with pedestrians to two potential conflict points. It would also move commercial loading activity away from the main pedestrian entrance, where pedestrians are likely to congregate. Fuel loading for the ferries would continue to occur in the pedestrian plaza after hours, when there would be no pedestrians in the plaza and pedestrian activity on the sidewalk would be low. Commercial loading activity under the proposed project is not expected to create conflicts with other modes of transportation. The proposed project would make no adjustments to the commercial loading at Fort Baker. Therefore, the proposed project's impacts on commercial loading would be less than significant.

Parking

As part of the 2012 on-site survey conducted at Pier 31½, parking-specific questions were asked to help determine where people park and where they may park in the future. Visitors who drove or carpooled were asked where they parked and estimates of total parking demand and parking location were developed from survey responses. Based on mode split data, the estimated parking demand increase associated with new visitors to Pier 31½ is just under 30 vehicles per day on weekdays and weekend days over the course of an entire day. This increase is in addition to the existing parking demand associated with the Pier 31½ facility, and is primarily associated with the addition of a third ferry berth. Parking estimates by time of day are shown in Table 15 for new visitors to Pier 31½.

TABLE 15
NET INCREASE IN PARKING DEMAND AT PIER 31½

	Week Day	Weekend Days
9:00 AM – 12:00 PM	8	8
12:00 PM – 3:00 PM	8	8
3:00 PM – 6:00 PM	8	8
6:00 PM – 9:00 PM	3	3
Daily Net Increase in Demand	26	27

Source: Fehr & Peers, *Alcatraz Embarkation Facility – Pier 31½ Circulation Study*,
San Francisco, CA, September 2017.

Under the proposed project, off-street parking for staff would be relocated into the interior of the Pier 31 shed building. Eight tandem parking spaces and four Americans with Disabilities Act-accessible spaces

would be provided. The Americans with Disabilities Act-accessible spaces would be available to staff as well as visitors. A total of eight unrestricted spaces is a reduction from the current staff parking supply and would not accommodate the staff parking demand observed during the June 2017 site visit. During the mid-day period, 12 staff vehicles were parked in the on-site lot. The unmet staff parking demand would either move to off-site lots or shift to another mode of travel. In the event that these staff continue to drive, their parking needs could be accommodated by the observed supply in nearby lots.

As shown in Table 15, the proposed project would increase parking demand by approximately eight spaces during the peak utilization period (12:00PM – 3:00PM). The 2013 EIS found that there are 1,125 off-street and 690 on-street parking spots within 0.25 mile of Pier 31½. During the peak utilization period parking was, on average, 80 percent occupied. Spot checks performed by Fehr & Peers in June 2017 of on-street and off-street parking showed that parking conditions have not substantially changed since the 2013 analysis. Given parking supply and observed utilization rates, it appears that the added visitor and staff parking demand could be accommodated by parking facilities within 0.25 mile.

Because no ferry ticket sales would take place at Fort Baker, there is no anticipated increase in parking demand at the site. All new visitors would arrive at the site via the ferry. Therefore, impacts related to parking would be less than significant.

A number of recommendations have been identified to improve safety for passengers, drivers, and cyclists at the Pier 31½ site. These include **Improvement Measures I-TR-2a, Provide Information on Active Transportation and Transit Routes to/from the Pier 31½ Site**, and **I-TR-2b, Install Multimodal Wayfinding Kiosk and Signage at the Pier 31½ Site**, as described below.

Improvement Measure I-TR-2a: Provide Information on Active Transportation and Transit Routes to/from the Pier 31½ Site

The project proponent will require the concessioner to provide information regarding pedestrian, bicycle, and transit travel to/from the embarkation site to both employees and in advance to visitors. This may include maps designating preferred pedestrian, bicycle or transit routes to/from the site, maps indicating where City-provided bicycle facilities or transit stops are present, and time estimates for walking or biking to common destinations, such as BART stations, Union Square, Pier 39, or other tourist destinations. This information would be presented on tickets and information websites, as well as distributed via mail or email to all ticketed visitors.

Improvement Measure I-TR-2b: Install Multimodal Wayfinding Kiosk and Signage at the Pier 31½ Site

The project proponent will add a multimodal wayfinding kiosk that may include maps, signs, or digital displays to provide visitors information on various travel options and times. The kiosk will be located near the site entrance/exit to the Pier 31½ site. In addition to a centralized kiosk, signage

could be placed at the site entrance with directional arrows indicating walk times to nearby destinations or transit stops.

Implementation of **Improvement Measures I-TR-2a, Provide Information on Active Transportation and Transit Routes to/from the Pier 31½ Site, and I-TR-2b, Install Multimodal Wayfinding Kiosk and Signage at the Pier 31½ Site**, would encourage staff and visitors to carpool, take transit, bicycle, and walk by providing additional information on these modes. This would reduce the number of people driving to access the site and alleviate effects on parking demand, loading demand, and bicyclist safety. Thus, if implemented, these improvement measures would further reduce the proposed project's less-than-significant impacts.

Impact TR-3: The proposed project would not substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses. (Less than Significant)

The proposed project would not include any design features that would substantially increase traffic hazards (e.g., a new sharp curve or dangerous intersections) at either the Pier 31½ or Fort Baker sites, and would not introduce any incompatible uses, as uses would be similar to current conditions. The proposed project would not add new driveways or curb cuts along the project frontages, and would reduce the use of the existing driveway in front of the project site. Therefore, the proposed project would have a less-than-significant impact related to transportation hazards due to a design feature or resulting from incompatible uses.

Impact TR-4: The proposed project would not result in inadequate emergency access. (Less than Significant)

Emergency access would remain unchanged from existing conditions; emergency vehicles would continue to access the Pier 31½ site from The Embarcadero, with the ability to drive onto the pedestrian plaza if necessary. Changes to the Fort Baker site would make no alterations to existing emergency vehicle access to the site or vicinity. Improvements to the Fort Baker pier would improve emergency access to the site from the water. The proposed project's impact to emergency vehicle access would therefore be less than significant.

Impact TR-5: The proposed project would not conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities. (Less than Significant)

Public Transit

According to transportation analysis conducted for the Park Service's EIS for the proposed project prior to the introduction of the E Embarcadero streetcar line, all transit lines serving the study area and the Downtown Screenlines operate within the 85 percent capacity utilization threshold in the weekday AM peak hour. However, in the weekday PM peak hour, the F Market & Wharves operate above the threshold in the outbound direction (i.e., away from the Pier 31½ site). Based on 2017 field work by Fehr

& Peers (subsequent to the introduction of the E Embarcadero historic streetcar), similar patterns were observed for the E Embarcadero as for the F Market & Wharves. The growth in transit ridership associated with the proposed project (compared to current conditions) would be less than 1 percent of the capacity of the transit line. The historic streetcars run in an exclusive right-of-way and would experience no delay due to new project-related trips. No transit impacts are anticipated as a result of the project pedestrian improvements at Fort Baker. Therefore, the proposed project would have a less-than-significant impact on transit capacity and delay.

Pedestrians

The proposed project would improve the pedestrian realm at the Pier 31½ site by eliminating frequent vehicular access/egress to the 15 on-site parking spaces from the site driveway. Although these entrance and exit movements are only moving to the Pier 31 driveway, and not being eliminated, the proposed arrangement reduces the number of active driveways, thereby also reducing the number of pedestrian conflict points with automobiles. Furthermore, vehicular driveway activity would be moved away from the main pedestrian plaza entrance, where pedestrians are likely to congregate.

The proposed project would further improve the pedestrian realm by creating a more spacious and welcoming pedestrian experience with enhanced exhibits and seating at Pier 31½ open to all members of the public, in addition to ticket-holding visitors. This includes converting the existing on-site parking into additional pedestrian space. Nearly all net new trips, regardless of mode, end as walking trips into the Pier 31½ site. Given the modest increase in new trips generated by the proposed project (Table 13) and the excess capacity of the sidewalk, pedestrian crowding is not expected to be severe or cause any hazards. The amount of new pedestrian activity generated by passenger loading activity is not expected to present substantial new conflicts, and would occur on the Embarcadero, which has sufficient space for this activity. Furthermore, the proposed project would not interfere with Americans with Disabilities Act accessibility to the site and adjoining areas. Existing Americans with Disabilities Act-compliant curb ramps are being retained, and three Americans with Disabilities Act-designated parking spaces would be added inside the Pier 31 bulkhead building. The existing curbside Americans with Disabilities Act-designated parking space, which would be converted to a loading zone as part of the proposed project, would be relocated to the curbside parking area just north of the Pier 33 bulkhead building.

At Fort Baker, the proposed project would greatly enhance pedestrian connectivity, especially Americans with Disabilities Act-compliant pedestrian connections. At present, there are no formal pedestrian paths connecting the pier with the Bay Area Discovery Museum or Cavallo Point Hotel and Conference Center. The proposed project would create a formal pedestrian path between the pier and the museum loading zone, enabling pedestrians of all abilities to make the trip. The proposed project would also install Americans with Disabilities Act-compliant curb ramps at the access road intersection just north of East Road between Murray Circle and McReynolds Road, allowing direct Americans with Disabilities Act access from the pier to the Cavallo Point Lodge and Conference Center.

For the reasons noted above, the proposed project would have a less-than-significant impact on pedestrian conditions.

Bicycle Conditions

The proposed project would relocate the existing bicycle racks into the Pier 31 shed building. No changes are proposed to bicycle travel lanes along The Embarcadero adjacent to the site, and removal of the site driveway would reduce the number of driveway conflict points between bicycles and automobiles. The proposed project is not expected to substantially increase overall traffic levels along nearby streets such that it could create potentially hazardous conditions for bicyclists or interfere with bicycle access or circulation to the site and adjoining areas. The small increase in bicyclists (17 AM peak hour and 24 PM peak hour walk/bike trips), along with a modest increase in other modes of access, is not expected to result in potentially hazardous conditions or interfere with bicyclist accessibility to the park.

The addition of the bollard-separated loading zone is expected to reduce potential conflicts between loading vehicles and northbound bicyclists. Passenger loading vehicles would have a designated space outside of the bicycle lane, and potential conflict points between bicyclists and loading vehicles would be reduced from the entire site frontage to the entry and exit of the new passenger loading zone. Bicycle conditions at Fort Baker are not anticipated to change with the proposed project, as there would be no changes to roadways. The proposed project would not generate any new bicycle trips at the Fort Baker site, because ferry passengers will not be permitted to bring bicycles on board ferries from Pier 31½ and rental bicycles are not available at the site, and none are planned. Potential nominal increases in vehicular traffic associated with for-hire vehicles serving ferry passengers would not result in substantial conflicts with bicycles. Bicycle conditions in Sausalito are discussed in Appendix B for informational purposes.

Therefore, the proposed project's impacts on bicycle conditions would be less than significant.

Impact C-TR-1: The proposed project, in combination of past, present, and reasonably foreseeable future projects, would not result in a considerable contribution to cumulative regional VMT. (Less than Significant)

VMT, by its very nature, is largely a cumulative impact. The VMT associated with past, present, and future projects contribute to physical secondary environmental impacts. It is likely that no single project by itself would be sufficient in size to prevent the region or state from meeting its VMT reduction goals. Instead, a project's individual VMT contributes to cumulative VMT impacts. The VMT and induced automobile travel project-level thresholds are based on levels at which new projects are not anticipated to conflict with state and regional long-term greenhouse gas emission reduction targets and statewide VMT per capita reduction targets set for 2020. Therefore, because the proposed project would not exceed the project-level thresholds for VMT and induced automobile travel (Impact TR-1), the proposed project would not result in a cumulatively considerable contribution to VMT impacts.

Furthermore, as shown in Table 16, the projected 2040 average daily VMT per employee for retail uses in TAZ 854 is 7.0 miles. This is approximately 59 percent below the projected 2040 regional average daily

VMT per employee of 14.6. Given that the project site is located in an area where VMT is more than 15 percent below the projected 2040 regional average, the proposed project would not contribute considerably to any substantial cumulative increase in VMT.

TABLE 16
DAILY VEHICLE MILES TRAVELED – YEAR 2040 CONDITIONS

Land Use	Bay Area		TAZ 854
	Regional Average	Regional Average Minus 15%	
Employment (Retail)	14.6	12.4	7.0

Source: San Francisco Transportation Information Map, <http://sftransportationmap.org/>, accessed May 2017.

Impact C-TR-2: The proposed project, in combination with past, present, and reasonably foreseeable future projects, would not result in substantial cumulative transportation impacts. (Less than Significant)

The geographic context for the analysis of cumulative traffic impacts is the local roadways and transit system within the Pier 31½ vicinity.

Construction

Project-related construction activities would not result in substantial interference with bicycle, pedestrian, or vehicle circulation, or to accessibility to adjoining areas and would not cause potentially hazardous conditions. The only future project anticipated to potentially result in nearby construction activity at Pier 31½ is the Embarcadero Enhancement Project, which does not yet have a construction schedule or plan available to the public. It will be important for the project proponent to coordinate its construction efforts and regular operational practices with the City when the time comes to create a construction plan and timeline for The Embarcadero Enhancement Project. There are no known current or future projects at Fort Baker that would result in nearby construction. Given current information, cumulative construction impacts are anticipated to be less than significant.

Passenger Loading

Loading activity at the Pier 31½ site is expected to increase with long-term increases to capacity on Alcatraz Island (associated with on-island facilities and visitor management), which are unrelated to the proposed project. This increased loading activity would be accommodated by the new loading zone, which provides increased capacity of 200 percent above existing demand levels. The combination of the long-term on-island capacity increases plus proposed project enhancements would increase demand by 26 percent (6 percent with proposed project and 20 percent with long-term on-island capacity increases). Bicycle and loading conflict points would be greatly minimized with the proposed loading zone design. Also, with future implementation of the Embarcadero Enhancement Project, which would separate bicyclists from the vehicular right-of-way, bicycle and passenger loading conflict points would be further reduced, if not entirely eliminated. No land use, development, or transportation projects are anticipated

to change cumulative conditions at Fort Baker. For these reasons, the cumulative impacts on passenger loading would be considered less than significant.

Commercial Loading Impacts

No changes are anticipated for commercial loading at Pier 31½ or Fort Baker. The only cumulative project that could potentially contribute to commercial loading impacts would be the Embarcadero Enhancement Project. With implementation of The Embarcadero Enhancement Project, driveway access to the Pier 31 and Pier 33 sheds is expected to be retained. Commercial loading at the Pier 31½ site associated with the proposed project under cumulative conditions would not create potentially hazardous traffic conditions or significant delays affecting traffic, transit, bicycles, or pedestrians. No land use, development, or transportation projects are anticipated to change cumulative conditions at Fort Baker. Therefore, the impact of the proposed project and other cumulative developments on loading conditions would be less than significant.

Transit Impacts

Under cumulative conditions, it is expected that transit demand would rise due to long-term growth in the vicinity of Pier 31½ and the region. The E and F Muni lines run directly in front of the Pier 31½ site and are the closest transit stations serving the proposed project; therefore, this capacity discussion focuses on these two lines. The E and F Muni lines fall under the Northeast screenline, which is projected to run at 72 percent capacity utilization during the PM peak under cumulative conditions, based on the latest figures for the downtown transit screenlines.⁴¹ The contribution of transit riders by the proposed project to the northeast screenline is not expected to reach the 85 percent capacity utilization threshold. Furthermore, cumulative conditions would not cause a substantial increase in delays or operating costs such that significant adverse impacts on transit service levels would occur. The E and F Muni lines would continue to run in the designated median right-of-way, where cumulative increases to vehicle and pedestrian traffic would have little impact to transit operations. No land use, development, or transportation projects are anticipated to change cumulative conditions at Fort Baker. Therefore, the cumulative impacts to transit are anticipated to be less than significant.

Pedestrian Impacts

Under cumulative conditions, pedestrian volumes are expected to increase at Pier 31½ due to long-term growth in the vicinity of the proposed project and the region. Although some pedestrian congestion could form due to the increase in pedestrians in the Pier 31½ area, the contribution to this congestion by the proposed project would be minimal. Because land uses are anticipated to change very little in the immediate vicinity, it is unlikely that pedestrian volumes would increase substantially over baseline levels. The proposed project, cumulative transportation network, and land use changes would not result in substantial overcrowding on public sidewalks, create potentially hazardous conditions for pedestrians, or otherwise interfere with pedestrian accessibility to the site and adjoining areas. No land use,

⁴¹ San Francisco Planning Department, *Transit Data for Transportation Impact Studies*, May 2015.

development, or transportation projects are anticipated to change cumulative conditions at Fort Baker. Therefore, the cumulative impact of the proposed project would be less than significant.

Bicycle Impacts

In the vicinity of the Pier 31½ site, cumulative bicycle projects include the Embarcadero Enhancement Project, the Battery Street bike lane, and the Ford GoBike expansion. These projects would enhance the environment for cyclists and pedestrians, potentially increasing the number of bicyclists in the project vicinity. The Embarcadero Enhancement Project is anticipated to have the most direct impact on the Pier 31½ site. By separating cyclists from pedestrians, parked vehicles, and moving vehicles along the Embarcadero, the area would become safer and more efficient. The bicycle/auto conflict points associated with passenger loading for the Pier 31½ site would likely be alleviated, if not entirely resolved, by designated bicycle lanes on the Embarcadero. These improvements would encourage more bicycle and pedestrian travel to the site, possibly reducing transit, driving, or drop-off mode shares for the project site in the long term. Very little land use-related mode shift to bicycles is anticipated under cumulative conditions because land use in the area will remain largely consistent with current conditions. When combined with the proposed project, the transportation network changes described above would not create potentially hazardous conditions for bicyclists or otherwise substantially interfere with bicycle accessibility to the site or adjoining areas.

The proposed project would not substantially affect bicycle conditions at Fort Baker, and so would not contribute to cumulative effects. No land use, development, or transportation projects are anticipated to change cumulative conditions at Fort Baker.

Therefore, the cumulative impact of the proposed project and surrounding projects would be less than significant.

Parking Impacts

Parking demand around the Pier 31½ site is expected to increase with long-term increases to capacity on Alcatraz Island and other long-term development in the area. However, the increased parking demand resulting from the proposed project would not be considerable, and cumulative parking demand would not result in a substantial parking deficit that could create potentially hazardous conditions affecting traffic, transit, bicycles, or pedestrians. Land use in the area is expected to change very little in the future and would therefore place no significant additional strain on the existing parking supply. The proposed project is not expected to influence parking at Fort Baker, and so would not contribute to cumulative effects. No land use, development, or transportation projects are anticipated to change cumulative conditions at Fort Baker. For these reasons, the cumulative parking impacts would be less than significant.

Emergency Vehicle Impacts

No changes are anticipated for emergency vehicle access or site access under the cumulative conditions. Roadway congestion is expected to increase due to long-term growth in the vicinity of the proposed

project and the region at both sites, which could cause delays for emergency vehicles in traversing the street network. This delay, however, would not result in inadequate emergency access that would significantly affect emergency access. Furthermore, the increased congestion resulting from the proposed project would be a small portion of this increase, and therefore, the impacts would be less than significant.

<i>Topics:</i>	<i>Potentially Significant Impact</i>	<i>Less Than Significant with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>	<i>Not Applicable</i>
6. NOISE—Would the project:					
a) Result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) For a project located within an airport land use plan area, or, where such a plan has not been adopted, in an area within two miles of a public airport or public use airport, would the project expose people residing or working in the area to excessive noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) For a project located in the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

The proposed project sites at Pier 31½ and Fort Baker are not within an airport land use plan area, nor are they in the vicinity of a private airstrip. Therefore, Topics 5(e) and 5(f) are not applicable.

Impact NO-1: The proposed project would not result in the exposure of persons to or generation of noise levels in excess of established standards, nor would the proposed project result in a substantial temporary or permanent increase in ambient noise levels. (Less than Significant)

Applicable Noise Standards

Construction

San Francisco Noise Ordinance. Article 29 of the San Francisco Police Code⁴² gives authority to the City to regulate unnecessary, excessive, and offensive noise. Under this ordinance, ambient sound is defined as the lowest repeating sound level within a 10-minute time period (at a minimum), and considered to be no less than 35 decibels (A-weighted; dBA) within interior residences and 45 dBA in all other locations. Regarding construction noise, Section 2907 prohibits such equipment that emits noise in excess of 80 dBA at 100 feet. However, impact tools and equipment (e.g., pile drivers, pavement breakers, and jackhammers) are exempt from this regulation, provided that they are affixed with approved noise-reducing shields or shrouds.

Marin County Noise Ordinance. Sections 6.70.030(5) and 6.70.040 of the Marin County Noise Ordinance address noise from construction activities. Pertinent to the proposed project, Marin County requires that loud noise-generating construction-related equipment only be operated Monday through Friday between 8:00 a.m. and 5:00 p.m.

Operations

San Francisco General Plan. The Environmental Protection Element of the San Francisco General Plan contains Land Use Compatibility Guidelines for Community Noise. These guidelines, which are similar to state guidelines promulgated by the Governor's Office of Planning and Research, indicate maximum acceptable noise levels for various newly developed land uses. The proposed uses for the proposed project correspond to the "Commercial" land use category as it represents a private operation on public (Port) land. For this land use category, the maximum "satisfactory, with no special insulation requirements" exterior noise levels are approximately 77 dBA (L_{dn} [average day/night equivalent sound level]).

The following thresholds are applied to determine the significance of project-related operational noise increases: 1) An increase of more than 5 dBA is considered a significant noise increase, and 2) in places where the existing or resulting noise environment is "conditionally acceptable," "conditionally unacceptable," or "unacceptable," based on the San Francisco Land Use Compatibility Chart for Community Noise, any noise increase greater than 3 dBA is considered a significant noise increase. A 5 dBA increase over ambient noise levels in any noise environment would be considered a substantial permanent increase in the ambient noise levels in the project vicinity because it would be clearly noticeable. A 3 dBA increase over ambient noise levels where the existing or resulting noise environment

⁴² City and County of San Francisco, *San Francisco Noise Ordinance*, 2008. Available from <http://www.noisefree.org/cityord/san-francisco.pdf>.

is “conditionally acceptable,” “conditionally unacceptable,” or “unacceptable” would be considered a substantial permanent increase in the ambient noise levels in the project vicinity because, although barely perceptible, it would add to an existing or resulting noise level that exceeds satisfactory standards for the applicable land use per the Land Use Compatibility Chart. As noted, noise levels for commercial areas related to transportation uses are acceptable to about 77 dBA.

San Francisco Noise Ordinance (Article 29 of the Police Code). Regarding operational noise, Article 29 of the San Francisco Police Code, Section 2909(c), states that no person shall produce or allow to be produced by any machine or device, or any combination of the same, a noise level more than 10 dBA above the local ambient sound level at a distance of 25 feet or more on public property, unless the machine or device is being operated to serve or maintain the property. In order to prevent sleep disturbance, protect public health, and prevent the acoustical environment from progressive deterioration, Section 2909(d) states that “no fixed noise source may cause the noise level measure inside any sleeping or living room in any dwelling unit located on residential property to exceed 45 dBA between the hours of 10 pm to 7 am or 55 dBA between the hours of 7 am to 10 pm with windows open except where building ventilation is achieved through mechanical systems that allow windows to remain closed.”

Pier 31½

Existing Conditions

Pier 31½ is located in a commercial zone within The Embarcadero, a highly-urbanized stretch along the waterfront that supports heavy pedestrian, bicycle, and automobile traffic. It is surrounded landward to the west by several commercial and office buildings, as well as cafés and restaurants. While land uses in the project site vicinity do not generate a substantial amount of noise, high traffic volumes along the surrounding streets result in a relatively loud noise environment. The closest residential zone (specifically, a high-density combined commercial/residential zone) is located one block away at the corner of Chestnut and Sansome streets. Ambient noise levels in the project vicinity are typical of noise levels found in San Francisco, which are dominated by vehicular traffic, including, cars, Muni streetcars and buses, and emergency vehicles. Based on data collected from the noise monitoring surveys conducted for the EIS, ambient noise levels at this site range from 56 to 68 dBA. The peak L_{max} recorded was 89 dBA, and the L_{min} was 46 dBA.⁴³

Some land uses (and associated users) are considered more sensitive to ambient noise levels than others. In general, occupants of residences, schools, daycare centers, hospitals, schools, places of worship, and nursing homes are considered to be sensitive receptors. The closest sensitive receptors are residences located approximately 540 feet southwest of the project site. There are no additional receptors within 900 feet of the Pier 31½ site.

⁴³ National Park Service, *Alcatraz Ferry Embarkation Final Environmental Impact Statement*, January 2017. Available from <https://parkplanning.nps.gov/document.cfm?parkID=303&projectID=41352&documentID=77056>.

Noise from Project Construction

Construction of the proposed project is expected to occur in phases, estimated to begin in late 2019 and conclude in 2021. Construction of upgraded berthing infrastructure is expected to occur in 2019, with pile driving occurring from barges lasting approximately 3 days. Interior building and exterior plaza renovations are expected to occur in phases between 2019 and 2022, with precise phasing ultimately confirmed by the concessioner. Work will occur on the landside using the types of construction equipment described in Table 5 (Section A, Project Description). The construction schedule is anticipated to be 8 hours per day, 5 days per week. Table 17 lists the typical noise levels of proposed construction equipment.

TABLE 17
TYPICAL NOISE LEVEL OF PROPOSED CONSTRUCTION EQUIPMENT

Equipment	Noise Level (dBA) ¹	
	At 50 feet	At 100 feet
Saw	76	70
Backhoe	80	74
Air Compressor	81	75
Generator	81	75
Mobile Crane	83	77
Grader	85	79
Truck	88	82
Paver	89	83
Pile Driver, Vibratory	96	90
Pile Driver, Impact	101	95

dBA: decibels, A-weighted

Construction noise is evaluated according to the following three criteria, taking into account the frequency, duration, equipment noise level, and proximity of sensitive receptors:

1. Comparing the maximum noise-generating potential for each individual piece of equipment proposed for use with the noise ordinance limit of 80 dBA at 100 feet (or equivalent sound level at some other convenient distance);
2. Comparing the combined noise level resulting from simultaneous operation of the two loudest pieces of equipment with the Federal Transit Administration's general construction assessment criterion of 90 dBA 1-hour L_{eq} ⁴⁴ at the nearest residential receptor; and
3. Determining if the combined noise level resulting from simultaneous operation of the two loudest pieces of equipment would be greater than 10 dBA above the background noise level.⁴⁵

⁴⁴ The 1-hour L_{eq} (or $L_{eq}[1h]$) represents the equivalent steady-state sound level that, in 1 hour, would contain the same acoustical energy.

Table 18 presents noise levels anticipated during construction of the proposed project at Pier 31½. The noise levels were estimated using the Federal Highway Administration Roadway Construction Noise Model (initialized with construction equipment specified) for the loudest construction phases with and without pile driving (i.e., gangway/float installation for the former and site demolition and preparation for the latter). The Roadway Construction Noise Model provides reference values (at 50 feet from the source) for the maximum sound levels (L_{max}) for each piece of equipment operating per phase. Noise levels are then adjusted to account for distance (i.e., lowered by 6 dBA with each doubling of distance between the equipment and the affected receptor) and added (using the rules of decibel addition) for each piece of equipment operating per phase to obtain the average total noise level (L_{eq}) at each receptor.

TABLE 18
CONSTRUCTION NOISE AT PIER 31½

Affected Receptor	Sensitive Receptors: Nearest Residential Zone	Other Receptors: Business Across Street
Distance from Outer Boundary of Receptor to Outer Boundary of Site (feet)	540	120
Existing Daytime Background Noise Level without Project (dBA, L_{eq})	63	63
During Pile Driving		
Modeled Maximum (L_{max}) Construction Noise Level (dBA)	80.8	93.7
Modeled Average Construction Noise Level (dBA, L_{eq})	73.9	86.8
Noise Ordinance Threshold	SFDPW-Certified Maximum Noise Attenuation	
Exceeds Threshold?	No	No
During Loudest Non-Pile-Driving (Non-Impact) Phase		
Predicted Maximum (L_{max}) Construction Noise Level (dBA)	69.1	82
Predicted Average Construction Noise Level (dBA, L_{dn})	63.8	76.7
Noise Ordinance Threshold	Any construction equipment $L_{max} > 80$ dBA at 100 feet	
Exceeds Threshold?	No	Yes

dBA: decibels, A-weighted
 L_{dn} : average day/night equivalent sound level
 L_{eq} : equivalent continuous sound level
 L_{max} : maximum sound level
SFDPW: San Francisco Department of Public Works

As shown in Table 18, noise from construction of the proposed project at Pier 31½ from non-impact equipment would not exceed 80 dBA at 100 feet or increase ambient noise levels by 10 dBA at the closest sensitive receptor. Therefore, non-impact noise would not exceed noise ordinance limits. Pile driving

⁴⁵ An increase of 10 dBA would represent a perceived doubling of noise above existing conditions, a potentially substantial temporary or periodic increase in ambient noise levels in the project vicinity.

would exceed the 80-dBA threshold but is considered an impact tool and therefore is exempt from noise ordinance limits, provided that such equipment is affixed with approved noise-reducing shields or shroud. Therefore, impacts are considered less than significant. While not significant under CEQA, construction noise has the potential to affect nearby businesses within 120 feet of construction. To ensure construction noise is minimized, the project proponent will implement **Improvement Measure I-NO-1, Construction Noise Minimization Plan for Pier 31½**.

Improvement Measure I-NO-1: Construction Noise Minimization Plan for Pier 31½

The project proponent shall develop a construction noise minimization plan that requires the following:

- Construction contractors shall specify noise-reducing construction practices and measures that will be employed to reduce construction noise from pile driving and construction activities. The practices and measures specified by the project proponent will be reviewed and approved by the City prior to the issuance of building permits. Practices and measures that can be used to limit noise include but are not limited to those listed below:
 - Avoid simultaneous use of equipment that exceeds 90 dBA, particularly impact and vibratory pile drivers
 - Install noise mufflers to stationary equipment and impact tools that are no less effective than those provided by the manufacturer
 - Use construction equipment with low noise emission ratings
 - Locate equipment, materials, and staging areas as far as practicable from sensitive receptors
 - Install barriers around particularly loud activities at the construction site to eliminate the line of sight between the source of noise and nearby sensitive receptors, which could reduce noise up to 10 dBA based on the configuration of the site and equipment used.⁴⁶
 - Prohibit unnecessary idling of vehicles or equipment
 - Require applicable construction-related vehicles or equipment to use designated truck routes to access the proposed project site
 - Restrict construction activities between 7:00 AM to 8:00 PM Monday through Saturday

⁴⁶ The Federal Highway Administration's *Roadway Construction Noise Model Users' Guide* gives the following "rules of thumb" for estimating noise attenuation of barriers at construction sites:

3 dBA - if a noise barrier or other obstruction (like a dirt mound) just barely breaks the line-of-sight between the noise source and the receptor;

5 dBA - if the noise source is partly enclosed OR shielded with a barrier with some gaps located close to the source;

8 dBA - if the noise source is completely enclosed OR completely shielded with a solid barrier located close to the source;

10 dBA - if the noise source is completely enclosed AND completely shielded with a solid barrier located close to the source;

15 dBA - if a building stands between the noise source and receptor and completely shields the noise source.

Noise from Operations

In general, peak visitation is controlled by the capacity of Alcatraz Island, and not necessarily the number of ferries that arrive and depart from the embarkation site. Under the proposed project, the embarkation facility would contain an additional berth that would operate additional ferry service to Fort Baker as well as offer interpretive cruises around the bay. Ferry service to Fort Baker would be limited to two ferries per day and occur on weekends only. Currently, 27 peak day ferry trips are operated per day for travel to Alcatraz Island and other locations from Pier 31½. Under the proposed project, ferry trips would increase to 29 peak day trips for an increase of two ferry trips per day. Noise surveys conducted for the EIS determined that the existing ambient noise levels at Pier 31½ range between 56 to 68 dBA. The Land Use Compatibility Chart provides criteria to assess compatibility of a proposed project with the existing noise environment. The operational significance threshold for this setting would be an increase of more than 5 dBA. Based on the limited number of new ferry trips, the proposed project is not expected to increase noise levels by 5 dBA.

As discussed in Section E.5, Transportation and Circulation, there are currently 6,160 daily person trips over a variety of modes (including walking, cars, public transportation, and tour buses) to the Pier 31½ site. The proposed project would result in 390 new daily trips. Given this minor increase and the existing noise environment, increased operations at Pier 31½ resulting from the proposed project would result in a negligible increase in noise and vibration within the surrounding area, and impacts would be considered less than significant.

Fort Baker

Existing Conditions

The Fort Baker pier is currently used for fishing and other recreational activities. Based on the Fort Baker Plan, ambient noise levels in the area range between 55 to 60 dBA, with “the western end of the site [having] more ambient urban noise from traffic along U.S. Highway 101.”^{47,48} The closest residence is approximately 1,500 feet north of the project site and there are no other sensitive receptors within 900 feet of the project site. Receptors in the area include the Bay Area Discovery Museum and the U.S. Coast Guard Station; however, neither of those receptors are considered sensitive.

Noise from Project Construction

Table 19 presents noise levels anticipated during construction of the proposed project at Fort Baker at the closest receptors.

⁴⁷ National Park Service, *Fort Baker Plan Final Environmental Impact Statement*, October 1999. Available from <http://parkplanning.nps.gov/document.cfm?parkID=303&projectID=20244&documentID=20847>.

⁴⁸ Conditions in the Fort Baker area are consistent with the levels identified in the plan as the user group has switched from active military operations to less intense recreational uses such as picnicking, hiking, and fishing.

**TABLE 19
CONSTRUCTION NOISE AT FORT BAKER**

Affected Receptor	USCG Station	Bay Area Discovery Museum
Distance from Outer Boundary of Receptor to Outer Boundary of Site (feet)	600	1,150
Existing Daytime Background Noise Level without Project (dBA, L _{eq})	55	55
During Pile Driving		
Predicted Maximum (L _{max}) Construction Noise Level (dBA)	79.7	74.0
Predicted Average Construction Noise Level (dBA, L _{dn})	72.8	67.1
Noise Ordinance Threshold	N/A	
Exceeds Threshold?	No	No
During Loudest Non-Pile-Driving Phase (Site Demolition)		
Predicted Maximum (L _{max}) Construction Noise Level (dBA)	68	62.3
Predicted Average Construction Noise Level (dBA, L _{dn})	62.7	57.1
Noise Ordinance Threshold	Work restricted to daytime hours	
Exceeds Threshold?	No	No

dBA: decibels, A-weighted

L_{dn}: average day/night equivalent sound level

L_{eq}: equivalent continuous sound level

L_{max}: maximum sound level

SFDPW: San Francisco Department of Public Works

USCG: U.S. Coast Guard

As shown in Table 19, noise from construction of the proposed project at Fort Baker would not exceed ordinance limits and would not impact sensitive receptors. Therefore, impacts would be considered less than significant, and mitigation is not required.

Noise from Project Operations

The proposed project would provide a ferry landing for new future occasional ferry embarkation service. As such, the current noise and vibration levels at this location and within the surrounding area may be affected by changes proposed by long-term operation at this site. However, the service would be occasional and intermittent, with a maximum of two ferries per weekend day.

**TABLE 20
OPERATIONAL NOISE FROM FORT BAKER LIMITED FERRY SERVICE**

Receptor	Recreational Use Area	USCG Station	Bay Area Discovery Museum
Land Use Category	3	3	3
Distance from Outer Boundary of Receptor to Closest Proposed Ferry Berth (feet)	160	800	1,290

Criteria for Moderate Impact (dBA)	60	60	60
Criteria for Severe Impact (dBA)	66	66	66
Impact?	None	None	None

dBA: decibels, A-weighted

L_{max}: maximum sound level

L_{dn}: average day/night equivalent sound level

USCG: U.S. Coast Guard

Based on the results presented in Table 20, receptors in the vicinity of the Fort Baker pier are not anticipated to be impacted by long-term operation of the proposed project. All predicted noise levels would remain below Federal Transit Administration criteria for commercial uses. For the reasons stated above, operational impacts resulting from the proposed project would be less than significant.

Impact NO-2: The proposed project could expose persons or structures to or generate excessive groundborne vibration or groundborne noise levels. (Less than Significant with Mitigation)

Groundborne noise is noise which is experienced inside a building or structure from vibrations produced outside of the building and transmitted as ground vibration between the source and receiver. The San Francisco Municipal Code does not address vibration. Regarding vibration impacts during construction, the Federal Transit Administration suggests a peak particle velocity level of 0.12 inches per second⁴⁹ or lower be maintained at buildings extremely susceptible to vibration damage (i.e., historic buildings such as those on the project site). Based on the peak particle velocity levels of the proposed construction equipment, the Federal Transit Administration's criteria for even the most fragile of buildings would be anticipated to be maintained so long as these buildings are 80 feet or more from the vibration source or site's outer boundary. Table 21 shows the distance from the Pier 31½ project site to receptors in the area that may be affected by vibration.

**TABLE 21
VIBRATION RECEPTORS IN THE VICINITY OF PIER 31½**

Receptor	Distance from Site (feet)¹
Historic Pier 29 Building	340
Historic Pier 31 and 33 Bulkhead Buildings	0
Businesses directly across the street from Pier 31½	120
Residences at the corner of Chestnut and Sansome streets	540

1. Per Federal Transit Administration guidance, distance was measured from the outer boundary of the receptors to the outer boundary of the Pier 31½ site.

dBA: decibels, A-weighted

VdB: vibration velocity decibels

Typical vibration levels from various types of construction equipment at 25 feet are listed in Table 22; some of these are similar to the equipment proposed to be used for the proposed project. Table 23 includes information on the vibratory damage potential at different buildings.

⁴⁹ Federal Transit Administration, *Transit Noise and Vibration Impact Assessment*, September 2013.

TABLE 22
TYPICAL VIBRATION LEVELS OF PROPOSED CONSTRUCTION EQUIPMENT

Equipment	Vibration Level (peak particle velocity, inches/second) ¹			
	At 10 feet	At 25 feet	At 50 feet	At 100 feet
Small Bulldozer	0.012	0.003	0.001	0.000
Jackhammer	0.138	0.035	0.012	0.004
Loaded Trucks	0.300	0.076	0.027	0.010
Large Bulldozer	0.352	0.089	0.031	0.011
Pile Driver, Vibratory	0.672	0.170	0.060	0.021
Pile Driver, Impact	2.546	0.644	0.228	0.081

1. The typical vibration levels (peak particle velocity [PPV]) of construction equipment at 25 feet are based on data provided in Table 12-2 of the Federal Transit Administration's 2006 *Transit Noise and Vibration Impact Assessment*. Per Federal Transit Administration guidance, the vibration levels of proposed construction equipment at other distances (i.e., 10, 50, and 100 feet) were calculated using the following equation: PPV at Distance D = PPV (at 25 feet) x $([25/D]^{1.5})$.

TABLE 23
GUIDELINE VIBRATION DAMAGE POTENTIAL THRESHOLD CRITERIA

Structure and Condition	Maximum Peak Particle Velocity (inches/second)	
	Transient Sources	Continuous/Frequent Intermittent Sources
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.2	0.1
Historic and some old buildings	0.5	0.25
Older residential structures	0.5	0.3
New residential structures	1	0.5
Modern industrial/commercial buildings	2	0.5

Transient sources create a single isolated vibration event, such as blasting or drop balls. Continuous/frequent, intermittent sources include impact pile drivers, pogo stick compactors stick compactors, crack and seat equipment, vibratory pile drivers, and vibratory compaction equipment. Source: Federal Transit Administration, *Transit Noise and Vibration Impact Assessment*, September 2013.

Regarding the proposed project work at Pier 31½ and in accordance with the Federal Transit Administration guidance stated above, vibration impacts at off-site receptors are not anticipated, as the closest off-site receptor to this site is 120 feet away. However, as noted in Table 23, the historic bulkhead buildings could be impacted by vibration, considering that construction activities are likely to occur in and around the buildings (essentially 0 feet from the vibration source or the building's outer boundary). This impact would be considered potentially significant. **Mitigation Measure M-NO-2, Conduct Vibration Monitoring at Pier 31½**, would be implemented to reduce impacts. Active monitoring would detect vibration near action levels and require the contractor to cease the use of large earth-moving equipment and to institute equipment controls to reduce vibration levels, thereby reducing the potential for effects on the building.

Mitigation Measure M-NO-2: Conduct Vibration Monitoring at Pier 31½

The project proponent would require that a qualified professional evaluate the subject structure(s) prior to the pile driving to assess their susceptibility to vibration impacts and provide pre-construction bracing if warranted. Based on the results of the evaluation, the professional shall develop a vibration control plan. The plan would include set of site-specific vibration attenuation measures that would be implemented under the supervision of a qualified acoustical consultant during the project construction. These attenuation measures would include as feasible, in consideration of technical and structural requirements and conditions, implementing “quiet” pile driving technology, such as predrilling piles, and using sonic pile drivers. During construction, the construction contractor will conduct vibration monitoring when construction activities occur within 50 feet of the historic Pier 31 and 33 bulkhead buildings. If monitoring indicates that peak particle velocity caused by construction activities is approaching 0.12 inches per second, construction activities would be halted and a plan would be developed to reduce vibration. Other effective strategies, such as use of smaller construction equipment in close proximity to buildings, may also be required to the extent necessary to achieve a peak particle velocity vibration level at bulkhead buildings of less than the level of 0.12 inches per second.

With the implementation of **M-NO-2, Conduct Vibration Monitoring at Pier 31½**, vibration impacts on historic structures at the Pier 31½ site would be considered less than significant.

Using the same Federal Transit Administration guidance and considering that the closest building to the outer boundary of the Fort Baker project site is more than 400 feet away, no significant vibration impacts are anticipated at Fort Baker. Impacts would be considered less than significant and mitigation is not required.

Impact C-NO: The proposed project would not make a considerable contribution to potential cumulative significant noise impacts. (Less than Significant)

The geographic scope of potential cumulative noise impacts encompasses the project sites and immediate vicinities. Construction of the proposed project could result in temporary noise and vibration increases; however, no significant impact would result from the proposed project. Cumulative noise increases in the site vicinity could occur if there are concurrent construction activities in the site vicinity. Cumulative projects listed in Table 6 could overlap, to some extent, with construction of the proposed project. There are no known projects under development within 0.25 mile of Fort Baker. Of the projects listed in Table 6, only the Pier 29 reconstruction, Port maintenance dredging, and ongoing routine repair and maintenance of Port facilities projects could pose cumulative noise impacts on residences if construction of these projects were to occur at the same time. In general, compliance with applicable noise ordinance requirements would maintain the noise impact from proposed project construction at a less-than-significant level. Project construction-related noise and vibration would not substantially increase ambient noise levels at locations greater than a few hundred feet from the project sites. As such, construction noise and vibration effects associated with the proposed project are not anticipated to

combine with those associated with other proposed and ongoing projects located near the project sites, and cumulative construction-related noise and vibration impacts would be less than significant.

Project-related stationary source noise from ferry operations would not substantially increase ambient noise levels at locations greater than a few hundred feet from the project site. A number of other ferry projects are currently under development in the Pier 31½ area; however, they are outside the 0.25-mile boundary and separated from the Pier 31½ area by buildings and structures that would minimize sound movement. There are no known projects under development within 0.25 mile of Fort Baker. Consequently, cumulative noise impacts from stationary noise sources would be less than significant.

Setting

The Bay Area Air Quality Management District (air district) is the regional agency with jurisdiction over the nine-county San Francisco Bay Area Air Basin, which includes San Francisco, Alameda, Contra Costa, Marin, San Mateo, Santa Clara, and Napa counties, and portions of Sonoma and Solano counties. The air district is responsible for attaining and maintaining federal and state air quality standards in the air basin, as established by the federal Clean Air Act and the California Clean Air Act, respectively. Specifically, the air district has the responsibility to monitor ambient air pollutant levels throughout the air basin and to develop and implement strategies to attain the applicable federal and state standards. The federal and state clean air acts require plans to be developed for areas that do not meet air quality standards, generally. The most recent air quality plan, the 2017 Clean Air Plan, was adopted by the air district on April 19, 2017. The 2017 Clean Air Plan updates the most recent Bay Area ozone plan, the 2010 Clean Air

Plan, in accordance with the requirements of the state Clean Air Act to implement all feasible measures to reduce ozone; provide a control strategy to reduce particulate matter, air toxics, and greenhouse gases in a single, integrated plan; and establish emission control measures to be adopted or implemented. The 2017 Clean Air Plan contains the following primary goals:

- Protect air quality and health at the regional and local scale: Attain all state and national air quality standards, and eliminate disparities among Bay Area communities in cancer health risk from toxic air contaminants; and
- Protect the climate: Reduce Bay Area greenhouse gas emissions to 40 percent below 1990 levels by 2030 and 80 percent below 1990 levels by 2050.

The 2017 Clean Air Plan is the most current applicable air quality plan for the air basin. Consistency with this plan is the basis for determining whether the proposed project would conflict with or obstruct implementation of an air quality plan.

Criteria Air Pollutants

In accordance with the state and federal clean air acts, air pollutant standards are identified for the following six *criteria air pollutants*: ozone, carbon monoxide (CO), particulate matter (PM), nitrogen dioxide (NO₂), sulfur dioxide (SO₂), and lead. These air pollutants are termed criteria air pollutants because they are regulated by developing specific public health- and welfare-based criteria as the basis for setting permissible levels. In general, the air basin experiences low concentrations of most pollutants when compared to federal or state standards. The air basin is designated as either in attainment⁵⁰ or unclassified for most criteria air pollutants with the exception of ozone, PM_{2.5}, and PM₁₀, for which these pollutants are designated as non-attainment for either the state or federal standards. By its very nature, regional air pollution is largely a cumulative impact in that no single project is sufficient in size to, by itself, result in non-attainment of air quality standards. Instead, a project's individual emissions contribute to existing cumulative air quality impacts. If a project's contribution to cumulative air quality impacts is considerable, then the project's impact on air quality would be considered significant.⁵¹

Land use projects may contribute to regional criteria air pollutants during the construction and operational phases of a project. Table 24 identifies air quality significance thresholds, followed by a discussion of each threshold. Projects that would result in criteria air pollutant emissions below these significance thresholds would not violate an air quality standard, contribute substantially to an air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants within the air basin.

⁵⁰ "Attainment" status refers to those regions that are meeting federal and/or state standards for a specified criteria pollutant. "Non-attainment" refers to regions that do not meet federal and/or state standards for a specified criteria pollutant. "Unclassified" refers to regions where there is not enough data to determine the region's attainment status for a specified criteria air pollutant.

TABLE 24
CRITERIA AIR POLLUTANT SIGNIFICANCE THRESHOLDS

Pollutant	Construction Thresholds	Operational Thresholds	
	Average Daily Emissions (pounds/day)	Average Daily Emissions (pounds/day)	Maximum Annual Emissions (tons/year)
ROG	54	54	10
NO _x	54	54	10
PM ₁₀	82 (exhaust)	82	15
PM _{2.5}	54 (exhaust)	54	10
Fugitive Dust	Construction Dust Ordinance or other Best Management Practices	Not Applicable	

NO_x: oxides of nitrogen

PM: particulate matter

ROG: reactive organic gases

Source: Bay Area Air Quality Management District, *California Environmental Quality Act Air Quality Guidelines*, May 2017, p. 2-1.

Ozone Precursors. As discussed previously, the air basin is currently designated as non-attainment for ozone and particulate matter. Ozone is a secondary air pollutant produced in the atmosphere through a complex series of photochemical reactions involving reactive organic gases (ROG) and oxides of nitrogen (NO_x). The potential for a project to result in a cumulatively considerable net increase in criteria air pollutants, which may contribute to an existing or projected air quality violation, is based on the state and federal clean air acts emissions limits for stationary sources. To ensure that new stationary sources do not cause or contribute to a violation of an air quality standard, air district regulation 2, rule 2 requires that any new source that emits criteria air pollutants above a specified emissions limit must offset those emissions. For ozone precursors ROG and NO_x, the offset emissions level is an annual average of 10 tons per year (or 54 pounds per day).⁵² These levels represent emissions below which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants.

Although this regulation applies to new or modified stationary sources, land use development projects result in ROG and NO_x emissions as a result of increases in vehicle trips, architectural coating, and construction activities. Therefore, the above thresholds can be applied to the construction and operational phases of land use projects, and those projects that result in emissions below these thresholds would not be considered to contribute to an existing or projected air quality violation or result in a considerable net increase in ROG and NO_x emissions. Due to the temporary nature of construction activities, only the average daily thresholds are applicable to construction phase emissions.

⁵² Bay Area Air Quality Management District, *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance*, October 2009, p. 17.

Particulate Matter (PM₁₀ and PM_{2.5}).⁵³ The air district has not established an offset limit for PM_{2.5}. However, the emissions limit in the federal New Source Review for stationary sources in nonattainment areas is an appropriate significance threshold. For PM₁₀ and PM_{2.5}, the emissions limit under New Source Review is 15 tons per year (82 pounds per day) and 10 tons per year (54 pounds per day), respectively. These emissions limits represent levels below which a source is not expected to have an impact on air quality.⁵⁴ Similar to ozone precursor thresholds identified above, land use development projects typically result in particulate matter emissions as a result of increases in vehicle trips, space heating and natural gas combustion, landscape maintenance, and construction activities. Therefore, the above thresholds can be applied to the construction and operational phases of a land use project. Again, because construction activities are temporary in nature, only the average daily thresholds are applicable to construction-phase emissions.

Fugitive Dust. Fugitive dust emissions are typically generated during construction phases. Studies have shown that the application of best management practices at construction sites significantly control fugitive dust⁵⁵ and individual measures have been shown to reduce fugitive dust by anywhere from 30 to 90 percent.⁵⁶ The air district has identified a number of best management practices to control fugitive dust emissions from construction activities.⁵⁷ The City's Construction Dust Control Ordinance (ordinance 176-08, effective July 30, 2008) requires a number of measures to control fugitive dust, and the best management practices employed in compliance with the ordinance are an effective strategy for controlling construction-related fugitive dust.

Other Criteria Pollutants. Regional concentrations of CO in the Bay Area have not exceeded the state standards in the past 11 years, and SO₂ concentrations have never exceeded the standards. The primary source of CO emissions from development projects is vehicle traffic. Construction-related SO₂ emissions represent a negligible portion of the total basin-wide emissions, and construction-related CO emissions represent less than five percent of the Bay Area total basin-wide CO emissions. As discussed previously, the Bay Area is in attainment for both CO and SO₂. Furthermore, the air district has demonstrated, based on modeling, that to exceed the California ambient air quality standard of 9.0 ppm (parts per million) (8-hour average) or 20.0 ppm (1-hour average) for CO, project traffic in addition to existing traffic would need to exceed 44,000 vehicles per hour at affected intersections (or 24,000 vehicles per hour where vertical and/or horizontal mixing is limited). Therefore, given the Bay Area's attainment status and the limited CO and SO₂ emissions that could result from development projects, development projects would

⁵³ PM₁₀ is often termed "coarse" particulate matter and is made of particulates that are 10 microns in diameter or smaller. PM_{2.5}, termed "fine" particulate matter, is composed of particles that are 2.5 microns or less in diameter.

not result in a cumulatively considerable net increase in CO or SO₂ emissions, and quantitative analysis is not required.

Local Health Risks and Hazards

In addition to criteria air pollutants, individual projects may emit toxic air contaminants. Toxic air contaminants collectively refer to a diverse group of air pollutants that are capable of causing chronic (i.e., of long-duration) and acute (i.e., severe but short-term) adverse effects to human health, including carcinogenic effects. Human health effects of toxic air contaminants include birth defects, neurological damage, cancer, and mortality. There are hundreds of different types of toxic air contaminants with varying degrees of toxicity. Individual toxic air contaminants vary greatly in the health risk they present; at a given level of exposure, one toxic air contaminant may pose a hazard that is many times greater than another.

Unlike criteria air pollutants, toxic air contaminants do not have ambient air quality standards, but are regulated by the air district using a risk-based approach to determine which sources and pollutants to control as well as the degree of control. A *health risk assessment* is an analysis in which human health exposure to toxic substances is estimated, and considered together with information regarding the toxic potency of the substances, to provide quantitative estimates of health risks.⁵⁸

Air pollution does not affect every individual in the population in the same way, and some groups are more sensitive to adverse health effects than others. Land uses such as residences, schools, children's day care centers, hospitals, and nursing and convalescent homes are considered to be the most sensitive to poor air quality because the population groups associated with these uses have increased susceptibility to respiratory distress or, as in the case of residential receptors, their exposure time is greater than that for other land uses. Therefore, these groups are referred to as sensitive receptors. Exposure assessment guidance typically assumes that residences would be exposed to air pollution 24 hours per day, seven days a week, for 30 years.⁵⁹ Therefore, assessments of air pollutant exposure to residents typically result in the greatest adverse health outcomes of all population groups.

Exposures to fine particulate matter (PM_{2.5}) are strongly associated with mortality, respiratory diseases, and lung development in children, and other endpoints such as hospitalization for cardiopulmonary disease.⁶⁰ In addition to PM_{2.5}, diesel particulate matter is also of concern. The California Air Resources Board identified diesel particulate matter as a toxic air contaminant in 1998, primarily based on evidence

⁵⁸ In general, a health risk assessment is required if the air district concludes that projected emissions of a specific air toxic compound from a proposed new or modified source suggest a potential public health risk. The applicant is then subject to a health risk assessment for the source in question. Such an assessment generally evaluates chronic, long-term effects, estimating the increased risk of cancer as a result of exposure to one or more toxic air contaminants.

⁵⁹ California Office of Environmental Health Hazard Assessment, *Air Toxics Hot Spot Program Risk Assessment Guidelines*, February 2015, pp. 4-44, 8-6.

⁶⁰ San Francisco Department of Public Health, *Assessment and Mitigation of Air Pollutant Health Effects from Intra-Urban Roadways: Guidance for Land Use Planning and Environmental Review*, May 2008.

demonstrating cancer effects in humans.⁶¹ The estimated cancer risk from exposure to diesel exhaust is much higher than the risk associated with any other toxic air contaminant routinely measured in the region.

In an effort to identify areas of San Francisco most adversely affected by sources of toxic air contaminants, San Francisco partnered with the air district to conduct a citywide *health risk assessment* based on an inventory and assessment of air pollution and exposures from mobile, stationary, and area sources within San Francisco. Areas with poor air quality, termed the “Air Pollutant Exposure Zone,” were identified based on health-protective criteria that consider estimated cancer risk, exposures to fine particulate matter, proximity to freeways, and locations with particularly vulnerable populations. A portion of the project site, Pier 31½, is located within the Air Pollutant Exposure Zone.

Excess Cancer Risk. The Air Pollution Exposure Zone includes areas where modeled cancer risk exceeds 100 incidents per million persons exposed. This criterion is based on U.S. Environmental Protection Agency guidance for conducting air toxic analyses and making risk management decisions at the facility and community-scale level.⁶² As described by the air district, the U.S. Environmental Protection Agency considers a cancer risk of 100 per million to be within the “acceptable” range of cancer risk. Furthermore, in the 1989 preamble to the benzene National Emissions Standards for Hazardous Air Pollutants rulemaking,⁶³ the U.S. Environmental Protection Agency states that it “...strives to provide maximum feasible protection against risks to health from hazardous air pollutants by (1) protecting the greatest number of persons possible to an individual lifetime risk level no higher than approximately one in one million and (2) limiting to no higher than approximately one in ten thousand [100 in one million] the estimated risk that a person living near a plant would have if he or she were exposed to the maximum pollutant concentrations for 70 years.” The 100 per one million excess cancer cases is also consistent with the ambient cancer risk in the most pristine portions of the Bay Area based on air district regional modeling.⁶⁴

Fine Particulate Matter. U.S. Environmental Protection Agency staff’s 2011 review of the federal PM_{2.5} standard concluded that the then current federal annual PM_{2.5} standard of 15 µg/m³ (micrograms per cubic meter) should be revised to a level within the range of 13 to 11 µg/m³, with evidence strongly supporting a standard within the range of 12 to 11 µg/m³.⁶⁵ The Air Pollutant Exposure Zone for San Francisco is based on the health protective PM_{2.5} standard of 11 µg/m³, as supported by the U.S.

⁶⁵ U.S. Environmental Protection Agency, *Policy Assessment for the Review of the Particulate Matter National Ambient Air Quality Standards*. “Particulate Matter Policy Assessment.” April 2011. Available from <https://www3.epa.gov/ttn/naaqs/standards/pm/data/20110419pmpafinal.pdf>.

Environmental Protection Agency's assessment, although lowered to 10 µg/m³ to account for uncertainty in accurately predicting air pollutant concentrations using emissions modeling programs.

Proximity to Freeways. According to the California air board, studies have shown an association between the proximity of sensitive land uses to freeways and a variety of respiratory symptoms, asthma exacerbations, and decreases in lung function in children. Siting sensitive uses in close proximity to freeways increases both exposure to air pollution and the potential for adverse health effects. As evidence shows that sensitive uses in an area within a 500-foot buffer of any freeway are at an increased health risk from air pollution,⁶⁶ parcels that are within 500 feet of freeways are included in the Air Pollutant Exposure Zone.

Health Vulnerable Locations. Based on the air district's evaluation of health vulnerability in the Bay Area, those zip codes (94102, 94103, 94105, 94124, and 94130) in the worst quintile of Bay Area health vulnerability scores as a result of air pollution-related causes were afforded additional protection by lowering the standards for identifying parcels in the Air Pollutant Exposure Zone to: 1) an excess cancer risk greater than 90 per one million persons exposed; and/or 2) PM_{2.5} concentrations in excess of 9 µg/m³.⁶⁷

The above citywide health risk modeling was also used as the basis in approving amendments to the San Francisco Building and Health codes, referred to as the Enhanced Ventilation Required for Urban Infill Sensitive Use Developments or Health Code, article 38 (ordinance 224-14, effective December 8, 2014). The purpose of article 38 is to protect the public health and welfare by establishing an Air Pollutant Exposure Zone and imposing an enhanced ventilation requirement for all urban infill sensitive use development within the Air Pollutant Exposure Zone. In addition, projects within the Air Pollutant Exposure Zone require special consideration to determine whether the project's activities would add a substantial amount of emissions to areas already adversely affected by poor air quality.

Construction Air Quality Impacts

Project-related air quality impacts fall into two categories: short-term impacts from construction and long-term impacts from project operation. The following addresses construction-related air quality impacts resulting from the proposed project.

Impact AQ-1: The proposed project's construction activities would generate fugitive dust and criteria air pollutants, but would not violate an air quality standard, contribute substantially to an existing or projected air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants. (Less than Significant)

⁶⁶ California Air Resources Board, *Air Quality and Land Use Handbook: A Community Health Perspective*, April 2005. Available from <http://www.arb.ca.gov/ch/landuse.htm>.

⁶⁷ San Francisco Planning Department and San Francisco Department of Public Health, *2014 Air Pollutant Exposure Zone Map (Memo and Map)*, April 9, 2014. These documents are part of San Francisco Board of Supervisors File No. 14806, Ordinance No. 224-14; Amendment to Health Code Article 38.

Construction activities (short-term) typically result in emissions of ozone precursors and PM in the form of dust (fugitive dust) and exhaust (e.g., vehicle tailpipe emissions). Emissions of ozone precursors and PM are primarily a result of the combustion of fuel from on-road and off-road vehicles. However, ROGs are also emitted from activities that involve painting, other types of architectural coatings, or asphalt paving.

The proposed project would include both in-water and land-based construction at Pier 31½ and Fort Baker, including the use of diesel powered construction equipment. At Pier 31½, construction would begin in 2019 and end in 2022, with active construction occurring over a period of 10 months. At Fort Baker, construction would occur in 2023, with active construction occurring over a period of 11 months. During the proposed project's construction period, construction activities would have the potential to result in emissions of fugitive dust and criteria air pollutants, discussed as follows.

Fugitive Dust

Project-related demolition, excavation, grading, and other construction activities may cause wind-blown dust that could contribute particulate matter into the local atmosphere. Depending on exposure, adverse health effects can occur due to this particulate matter in general and also due to specific contaminants, such as lead or asbestos, that may be constituents of soil. Although there are federal standards for air pollutants and implementation of state and regional air quality control plans, air pollutants continue to have impacts on human health throughout the country. California has found that particulate matter exposure can cause health effects at lower levels than national standards. The current health burden of particulate matter demands that, where possible, public agencies take feasible available actions to reduce sources of particulate matter exposure. According to the California Air Resources Board, reducing PM_{2.5} concentrations to state and federal standards of 12 µg/m³ in the San Francisco Bay Area would prevent between 200 and 1,300 premature deaths.⁶⁸

Pier 31½

In response to California Air Resources Board guidance, the San Francisco Board of Supervisors approved the Construction Dust Control Ordinance (ordinance 176-08, effective July 30, 2008) with the intent of reducing the quantity of dust generated during site preparation, demolition, and construction work in order to protect the health of the general public and of on-site workers, minimize public nuisance complaints, and to avoid orders to stop work by the Port's Building Permit Group.

The Construction Dust Control Ordinance requires that all site preparation work, demolition, or other construction activities within San Francisco that have the potential to create dust or to expose or disturb more than 10 cubic yards or 500 square feet of soil comply with specified dust control measures whether or not the activity requires a permit from the Port. The Director of the Port's Building Permit Group may

⁶⁸ California Air Resources Board, *Methodology for Estimating Premature Deaths Associated with Long-term Exposure to Fine Airborne Particulate Matter in California*, Staff Report, Table 4c, October 24, 2008.

waive this requirement for activities on sites less than 0.5 acre that are unlikely to result in any visible wind-blown dust.

For projects over 0.5 acre, the Dust Control Ordinance requires that the project proponent submit a Dust Control Plan for approval by the San Francisco Department of Public Health. The Port will not issue a building permit without written notification from the Director of Public Health that the applicant has a site-specific Dust Control Plan, unless the Director waives the requirement. Interior-only tenant improvement projects that are over 0.5 acre in size that will not produce exterior visible dust are exempt from the site-specific Dust Control Plan requirement. In addition to the Dust Control Ordinance, County- and City-led projects must follow specific department guidance which incorporates the City's dust control requirements. For the Port, these dust control ordinances are codified under Section 106A.3.2.3, Construction Dust Control.

Construction at Pier 31½ has the potential to generate low levels of fugitive dust. Work on the Pier 31 and 33 bulkhead buildings would be to the building interiors, which would reduce exposure to fugitive dust, but movement of construction equipment and repaving may expose sensitive receptors to fugitive dust. The closest sensitive receptor is a residence located 540 feet southwest of the site. Repaving would occur over approximately 0.9 acre. Therefore, a dust control plan will be developed for the Pier 31½ project site. The dust control plan will incorporate dust control ordinance consistent with the Port's requirements. The project proponent and the contractor responsible for construction activities at the project site would be required to use the practices described below to control construction dust on the site or other practices that result in equivalent dust control that are acceptable to the director:

- Water all active construction areas sufficiently to prevent dust from becoming airborne. Increased watering frequency may be necessary whenever wind speeds exceed 15 miles per hour.
- Provide as much water as necessary to control dust (without creating run-off) in any area of land clearing, earth movement, excavation, drilling, and other dust-generating activity.
- During excavation and dirt-moving activities, wet sweep or vacuum the streets, sidewalks, paths, and intersections where work is in progress at the end of the workday.
- Cover any inactive (no disturbance for more than 7 days) stockpiles greater than 10 cubic yards or 500 square feet of excavated materials, backfill material, import material, gravel, sand, road base, and soil with a 10 mil (0.01 inch) polyethylene plastic or equivalent tarp and brace it down or use other equivalent soil stabilization techniques.
- Use dust enclosures, curtains, and dust collectors as necessary to control dust in the excavation area.

The site-specific Dust Control Plan would also require the project proponent to: submit a map to the Director of Public Health showing all sensitive receptors within 1,000 feet of the site; wet down areas of soil at least three times per day; provide an analysis of wind direction and install upwind and downwind particulate dust monitors; record particulate monitoring results; hire an independent third-party to conduct inspections and keep a record of those inspections; establish shut-down conditions based on

wind, soil migration, etc.; establish a hotline for surrounding community members who may be potentially affected by project-related dust; limit the area subject to construction activities at any one time; install dust curtains and windbreaks on the property lines, as necessary; limit the amount of soil in hauling trucks to the size of the truck bed and securing with a tarpaulin; enforce a 15-mph speed limit for vehicles entering and exiting construction areas; sweep affected streets with water sweepers at the end of the day; install and utilize wheel washers to clean truck tires; terminate construction activities when winds exceed 25-mph; apply soil stabilizers to inactive areas; and sweep off adjacent streets to reduce particulate emissions. The project proponent would be required to designate an individual to monitor compliance with these dust control requirements. With compliance with the dust control ordinance, project construction impacts related to exposure to fugitive dust emissions would be less than significant.

Fort Baker

Construction of the path at Fort Baker has the potential to result in dust. However, because the closest sensitive receptors are located well over 1,000 feet away from construction and construction would incorporate applicable air district construction best management practices, sensitive receptors would not be affected by fugitive dust. Studies have shown that the application of best management practices at construction sites controls fugitive dust significantly, and individual measures have been shown to reduce fugitive dust by anywhere from 30 to 90 percent. For fugitive dust, the air district does not have numerical thresholds; a project is considered less than significant for fugitive dust if it complies with the air district's construction best management practices. Because the construction contract would require compliance with the air district's construction best management practices related to dust control, potential dust-related air quality impacts from construction at Fort Baker would be less than significant.

Criteria Air Pollutants

As discussed above, construction activities would result in emissions of criteria air pollutants from the use of off- and on-road vehicles and equipment. Land-based construction-related criteria air pollutants generated by the proposed project were quantified using the California Emissions Estimator Model (CalEEMod). Marine-based (tugboats and work boats) construction-related criteria air pollutants generated by the proposed project were quantified using the California Air Resources Board harbor craft emissions inventory⁶⁹ and U.S. Environmental Protection Agency marine engine standards. Both land-based and marine-based emissions are provided in the *Air Quality and Greenhouse Gas Technical Report*.⁷⁰ The CalEEMod model was developed, including default data (emission factors, meteorology, etc.), in collaboration with California air district staff. Default assumptions were used where project-specific information was unknown.

⁶⁹ California Air Resources Board, *California Harbor Craft Emissions Inventory Database*, 2010.

⁷⁰ Anchor QEA, *Air Quality and Greenhouse Gas Technical Report*, Alcatraz Ferry Embarkation Project, Case No. 2017-000188ENV, December 2017.

Construction of the proposed project would occur over an approximately 21-month period between 2019 and 2023, and the construction schedule is anticipated to be 8 hours per day, 5 days per week. Emissions were converted from tons per year to pounds per day using the estimated construction duration of 504 total working days. As shown in Table 25, proposed project construction emissions would be below the threshold of significance for all criteria pollutants.

Notes:

Emissions may not add precisely due to rounding.

NO_x: oxides of nitrogen

PM₁₀: particulate matter, diameter <10 microns

PM_{2.5}: particulate matter, diameter <2.5 microns

ROG: reactive organic gases

As shown, emissions at both locations would be less than significant. Therefore, construction-related emissions would not violate air quality standards or contribute significantly to an existing or projected air quality violation and impacts would be less than significant.

The proposed project was the subject of an EIS prepared by the Park Service⁷¹, which included a number of construction air quality impact reduction measures. The following measures from the EIS are included in the Record of Decision and therefore will be applied to construction of the proposed project as **Improvement Measures I-AQ-1a, Use Cleaner Construction Equipment**, and **I-AQ-1b, Use Cleaner Engines on Tugboats**:

Improvement Measure I-AQ-1a: Use Cleaner Construction Equipment

The project proponent shall develop a plan demonstrating that the off-road equipment (more than 50 horsepower) to be used in the construction project (i.e., owned, leased, and subcontractor vehicles) would achieve a project wide fleet-average 20 percent nitrogen oxide (NOx) reduction and 45 percent particulate matter (PM) reduction compared to the most recent California Air Resources Board fleet average. Acceptable options for reducing emissions include the use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, add-on devices such as particulate filters, and/or other options as such become available.

Improvement Measure I-AQ-1b: Use Cleaner Engines on Tugboats

The project proponent shall use tugboats with Tier 4 propulsion engines and Tier 3 auxiliary engines.

Table 26 presents the results of construction emissions following the implementation of **Improvement Measures I-AQ-1a, Use Cleaner Construction Equipment**, and **I-AQ-1b, Use Cleaner Engines on Tugboats**. As shown, the proposed project's less-than-significant impacts would be further reduced.

Notes:

Emissions may not add precisely due to rounding.

NO_x: oxides of nitrogen

PM₁₀: particulate matter, diameter <10 microns

PM_{2.5}: particulate matter, diameter <2.5 microns

ROG: reactive organic gases

Impact AQ-2: The proposed project's construction activities would generate toxic air contaminants, including diesel particulate matter, but would not expose sensitive receptors to substantial pollutant concentrations. (Less than Significant)

Pier 31½ is located within the Air Pollutant Exposure Zone, as described above. The closest sensitive land uses near the Pier 31½ site are residences along Sansome Street, located approximately 540 feet southwest of the site. The closest sensitive land uses near the Fort Baker site are residences along Murray Circle, located approximately 700 feet northwest of the site and over 1,400 feet northwest of in-water construction.

Off-road construction equipment is a large contributor to particulate matter emissions, of which diesel particulate matter is a major component. In California, although emissions associated with off-road equipment have declined and are projected to continue to decline with implementation of the U.S. Environmental Protection Agency's engine requirements for new off-road engines and the California Air Resources Board's requirements for in-use off-road equipment. Specifically, both the U.S. Environmental Protection Agency and California have set emissions standards for new off-road equipment engines, ranging from Tier 1 to Tier 4. Tier 1 emission standards were phased in between 1996 and 2000 and Tier 4 Interim and Final emission standards for all new engines were phased in between 2008 and 2015. To meet the Tier 4 emission standards, engine manufacturers are required to produce new engines with advanced emission-control technologies. Although the full benefits of these regulations will not be realized for several years, the U.S. Environmental Protection Agency estimates that by implementing the federal Tier 4 standards, NO_x and particulate matter emissions will be greatly reduced.⁷² For example, the California Air Resources Board's 2011 emissions inventory predicts a particulate matter emissions decrease of nearly 80 percent in 2029, the last projected year in the inventory, from 2010 emissions and predicts an average annual decrease of 4 percent from 2010 emissions.⁷³

In addition, construction activities do not lend themselves to analysis of long-term health risks because of their temporary and variable nature. As explained in the air district's *CEQA Air Quality Guidelines*:

"Due to the variable nature of construction activity, the generation of TAC emissions in most cases would be temporary, especially considering the short amount of time such equipment is typically within an influential distance that would result in the exposure of sensitive receptors to substantial concentrations. Concentrations of mobile-source diesel PM emissions are typically reduced by 70 percent at a distance of approximately 500 feet (California Air Resources Board 2005). In addition, current models and methodologies for conducting health risk assessments are associated with longer-term exposure periods of 9, 40, and 70 years, which do not correlate well

⁷² U.S. Environmental Protection Agency, *Clean Air Nonroad Diesel Rule: Fact Sheet*, May 2004.

⁷³ California Air Resources Board, *In-Use Off-Road Equipment, 2011 Inventory Model*, cited August 21, 2017. Available from http://www.arb.ca.gov/msei/categories.htm#inuse_or_category.

with the temporary and highly variable nature of construction activities. This results in difficulties with producing accurate estimates of health risk.”⁷⁴

Therefore, project-level analyses of construction activities have a tendency to produce overestimated assessments of long-term health risks. However, within the Air Pollutant Exposure Zone, as discussed above, additional construction activity may adversely affect populations that are already at a higher risk for adverse long-term health risks from existing sources of air pollution. An air quality technical report was prepared that quantified emissions for both construction and operation of the proposed project.⁷⁵ Health impacts associated with the proposed project construction were evaluated qualitatively by comparing the proposed project’s diesel particulate matter and PM_{2.5} emissions to those of the Third Street Bridge Rehabilitation Project, a project of similar scale for which a detailed health risk assessment was performed and emissions of toxic air contaminants were determined not to pose a significant health risk for the maximum exposed sensitive receptors.⁷⁶ In general, an evaluation of health impacts is based on projected emissions, locations of sensitive receptors, and meteorological conditions in the project vicinity. Because the proposed project’s construction emissions would be less than that of the Third Street Bridge Rehabilitation project and the closest sensitive receptors would be located at a greater distance, it was determined that a health risk assessment was not necessary to conclude that the potential health risks resulting from project construction at Pier 31½ would be less than significant.⁷⁷ At Fort Baker, potential health risks would be even lower, due to the shorter duration of construction activities and the greater distance to sensitive receptors.

For these reasons, the proposed project would not expose sensitive receptors to substantial health risks and impacts would be less than significant.

Operational Air Quality Impacts

Land use projects typically result in emissions of criteria air pollutants and toxic air contaminants primarily from an increase in motor vehicle trips. However, land use projects may also result in emissions of criteria air pollutants and toxic air contaminants from combustion of natural gas, landscape maintenance, use of consumer products, and architectural coating. The following addresses air quality impacts resulting from operation of the proposed project.

⁷⁴ Bay Area Air Quality Management District, *CEQA Air Quality Guidelines*, pp. 6-8, May 2011.

⁷⁶ Taha Environmental Planners, *Third Street Bridge Rehabilitation Project Air Quality and Greenhouse Gas Technical Memorandum*, Planning Department Case No. 2015-009647ENV, April 17, 2017.

⁷⁷ Anchor QEA, Memorandum re: Health Risk Assessment for the Alcatraz Ferry Embarkation Project, Case No. 2017-000188ENV, November 13, 2017.

Impact AQ-3: During project operations, the proposed project would result in emissions of criteria air pollutants, but not at levels that would violate an air quality standard, contribute to an existing or projected air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants. (Less than Significant)

As discussed above in Impact AQ-1, the air district, in its *CEQA Air Quality Guidelines*, has developed screening criteria to determine whether a project requires an analysis of project-generated criteria air pollutants. If all the screening criteria are met by a proposed project, then the lead agency or applicant does not need to perform a detailed air quality assessment.

The proposed project would generate criteria pollutant emissions associated with ferry and vehicle traffic (mobile sources), on-site area sources (i.e., natural gas combustion for space and water heating, and combustion of other fuels by building and grounds maintenance equipment), energy usage, and testing of a backup diesel generator. Land-based operational-related criteria air pollutants generated by the proposed project were quantified using CalEEMod. Ferry emissions were calculated using the California Air Resources Board harbor craft emissions inventory and U.S. Environmental Protection Agency emission standards. Both land-based and marine-based operational emissions are provided in the *Alcatraz Embarkation Air Quality and GHG Study*.⁷⁸ Default assumptions were used where project-specific information was unknown. The analysis also assumed incorporation of the Park Service's requirements for clean ferries, as discussed in Section A, Project Description. These conditions will require that: 1) all ferries use U.S. Environmental Protection Agency Tier 3 engines or better within 2 years of the effective date of the concessioner agreement; 2) ferries use clean fuel; and 3) ferries meet strict idling limits. These conditions would decrease ferry emissions and offset the activity increase. The conditions will be required as part of the concession contract by the Park Service and are therefore an enforceable part of the proposed project.

The annual and average daily emissions associated with operation of the proposed project (incorporating the project conditions discussed above) are shown in Tables 27 and 28, which also include the City's thresholds of significance. The proposed operations would result in cleaner ferry engines and therefore less ROG, PM₁₀, and PM_{2.5} emissions than were emitted under baseline conditions.

NOx: oxides of nitrogen

PM: particulate matter

ROG: reactive organic gases

As shown in Tables 27 and 28, the proposed project would not exceed any of the significance thresholds for criteria air pollutants, and would result in less-than-significant impacts with respect to criteria air pollutants.

Impact AQ-4: The proposed project operations would generate toxic air contaminants, including diesel particulate matter, exposing sensitive receptors to substantial air pollutant concentrations. (Less than Significant with Mitigation)

As discussed above, the Pier 31½ site is located in proximity to sensitive land uses and within the Air Pollutant Exposure Zone. The closest sensitive land uses near the Pier 31½ site are residences along Sansome Street, located approximately 540 feet southwest of the site. The closest sensitive land uses near the Fort Baker site are residences along Murray Circle, located approximately 700 feet northwest of the site and over 1,400 feet northwest of in-water construction.

Health effects of project operational emissions were assessed qualitatively based on projected emissions, locations of sensitive receptors, and meteorological conditions in the project vicinity.⁷⁹ Proposed project operational emissions would not expose sensitive receptors to substantial air pollutant concentrations for the following reasons:

- Operational emissions associated with the proposed project would, for the most part, occur over water and as such be located away from human receptors. Ninety-five percent of projected operational emissions would result from ferry operations. Of this, less than 10 percent would be due to ferries operating at berth. In other words, more than 90 percent of projected operational emissions would occur in the water and away from on-land receptors. Further, the prevailing wind direction is from the west, away from sensitive receptors.
- Operational emissions would be greater than the 2016 baseline only during the first 5 years of proposed project operation. Table 28 shows that the incremental difference (project minus

⁷⁹ Anchor QEA, Memorandum re: Health Risk Assessment for the Alcatraz Ferry Embarkation Project, November 13, 2017.

baseline) would be approximately 0.3 pound per day of PM₁₀ and PM_{2.5}. This increase would primarily be due to the increase in ferry activity in the first 5 years of proposed project operation. Starting in 2026, the Park Service will require that all ferries use U.S. Environmental Protection Agency Tier 3 engines or better. This requirement would decrease ferry emissions and offset the activity increase such that daily emissions starting in 2026 would be below the 2016 baseline.

- Greater separation distances generally contribute to a lower health risk. The California Air Resources Board holds that, in general, impacts from exposures to diesel particulate matter decline by approximately 90 percent at 300 to 500 feet from the emissions source. Sensitive receptors would be located approximately 540 feet from Pier 31½.

Vehicle trips associated with the project would be well below the air district's thresholds. The air district considers roads with less than 10,000 vehicles per day to be "minor, low-impact" sources that do not pose a significant health impact even in combination with other nearby sources and recommends that these sources be excluded from the environmental analysis. The proposed project's 672 vehicle trips (all generated at Pier 31½) would be well below this level and would be distributed among the local roadway network.

The proposed project would also include a backup emergency generator at Pier 31½. Emergency generators are regulated by the air district through their New Source Review (Regulation 2, Rule 5) permitting process. The project proponent would be required to obtain applicable permits to operate an emergency generator from the air district. Although emergency generators are intended only to be used in periods of power outages, monthly testing of the generator would be required. Air district limits testing to no more than 50 hours per year. Additionally, as part of the permitting process, the air district would limit the excess cancer risk from any facility to no more than ten per one million population and requires any source that would result in an excess cancer risk greater than one per one million population to install Best Available Control Technology for Toxics. However, because the project site is located in an area that already experiences poor air quality, the proposed emergency back-up generator has the potential to expose sensitive receptors to substantial concentrations of diesel emissions, a known toxic air contaminant, which could result in a significant air quality impact. **Mitigation Measure M-AQ-4, Best Available Control Technology for Diesel Generators at Pier 31½**, would be implemented to reduce impacts.

Mitigation Measure M-AQ-4: Best Available Control Technology for Diesel Generators at Pier 31½

The project proponent shall ensure that the backup diesel generator meets or exceeds one of the following emission standards for particulate matter: 1) Tier 4-certified engine; or 2) Tier 2- or Tier 3-certified engine that is equipped with a California Air Resources Board Level 3 Verified Diesel Emissions Control Strategy. A non-verified diesel emission control strategy may be used if the filter has the same particulate matter reduction as the identical California Air Resources Board-verified

model and if the Bay Area Air Quality Management District approves of its use. The project proponent shall submit documentation of compliance with the Bay Area Air Quality Management District New Source Review permitting process (Regulation 2, Rule 2, and Regulation 2, Rule 5) and the emission standard requirement of this mitigation measure to the Planning Department for review and approval prior to issuance of a permit for a backup diesel generator from any City agency.

Implementation of this measure would reduce emissions by 89 to 94 percent compared to equipment with engines that do not meet any emission standards and without a Verified Diesel Emissions Control Strategy. Therefore, although the proposed project would add a new source of toxic air contaminants within an area that already experiences poor air quality, implementation of **Mitigation Measure M-AQ-4, Best Available Control Technology for Diesel Generators at Pier 31½**, would reduce this impact to a less-than-significant level.

Impact AQ-5: The proposed project would not conflict with, or obstruct implementation of, the 2017 Clean Air Plan. (Less than Significant)

The most recently adopted air quality plan for the air basin is the *2017 Clean Air Plan*. The *2017 Clean Air Plan* is a road map that demonstrates how the San Francisco Bay Area will achieve compliance with the state ozone standards as expeditiously as practicable and how the region will reduce the transport of ozone and ozone precursors to neighboring air basins. In determining consistency with the plan, this analysis considers whether the project would: 1) support the primary goals of the plan; 2) include applicable control measures from the plan; and 3) avoid disrupting or hindering implementation of control measures identified in the plan.

The primary goals of the plan are to: 1) protect air quality and health at the regional and local scale; 2) eliminate disparities among Bay Area communities in cancer health risk from toxic air contaminants; and 3) protect the climate by reducing greenhouse gas emissions. To meet the primary goals, the plan recommends specific control measures and actions. These control measures are grouped into various categories and include stationary and area source measures, mobile source measures, transportation control measures, land use measures, and energy and climate measures. The plan recognizes that to a great extent, community design dictates individual travel mode, and that a key long-term control strategy to reduce emissions of criteria pollutants, air toxics, and greenhouse gases from motor vehicles is to channel future Bay Area growth into vibrant urban communities where goods and services are close at hand, and people have a range of viable transportation options. To this end, the plan includes 85 control measures aimed at reducing air pollution in the air basin.

The measures most applicable to the proposed project are transportation control measures and energy and climate control measures. The proposed project's impact with respect to greenhouse gases are discussed in Section E.8, Greenhouse Gas Emissions, which demonstrates that the proposed project would comply with the applicable provisions of the City's Greenhouse Gas Reduction Strategy.

The compact development of the proposed project and high availability of viable transportation options ensure that visitors could bicycle, walk, and ride transit to and from the project site instead of taking trips via private automobile. While Fort Baker is less accessible than Pier 31½, visitors to Fort Baker as part of the proposed project would access the park from Pier 31½, as ticket sales would not be available at Fort Baker (i.e., all passengers would originate from Pier 31½; new passengers would not be able to board the ferry at Fort Baker for a trip to Pier 31½). These features ensure that the proposed project would avoid substantial growth in automobile trips and vehicle miles traveled. The proposed project's anticipated 672 net new daily vehicle trips would result in a negligible increase in air pollutant emissions. Furthermore, the proposed project would be generally consistent with the San Francisco General Plan, as discussed in Section E.5, Transportation and Circulation. Transportation control measures that are identified in the 2017 *Clean Air Plan* are implemented by the *San Francisco General Plan* and the Planning Code, for example, through the City's Transit First Policy, bicycle parking requirements, and transit impact development fees. Compliance with these requirements would ensure the proposed project includes relevant transportation control measures specified in the 2017 *Clean Air Plan*. Therefore, the proposed project would include applicable control measures identified in the 2017 *Clean Air Plan* to meet the 2017 *Clean Air Plan*'s primary goals.

Examples of a project that could cause the disruption or delay of 2017 *Clean Air Plan* control measures are projects that would preclude the extension of a transit line or bike path, or projects that propose excessive parking beyond parking requirements. The proposed project would develop and operation of an improved ferry embarkation site to support Alcatraz Island and Fort Baker visitors in a dense, walkable urban area near a concentration of regional and local transit service. It would not preclude the extension of a transit line or a bike path or any other transit improvement, and thus would not disrupt or hinder implementation of control measures identified in the 2017 *Clean Air Plan*.

For the reasons described above, the proposed project would not interfere with implementation of the 2017 *Clean Air Plan*, and because the proposed project would be consistent with the applicable air quality plan that demonstrates how the region will improve ambient air quality and achieve the state and federal ambient air quality standards, this impact would be less than significant.

Impact AQ-6: The proposed project would not create objectionable odors that would affect a substantial number of people. (Less than Significant)

Typical odor sources of concern include wastewater treatment plants, sanitary landfills, transfer stations, composting facilities, petroleum refineries, asphalt batch plants, chemical manufacturing facilities, fiberglass manufacturing facilities, auto body shops, rendering plants, and coffee roasting facilities. During construction, diesel exhaust from construction equipment would generate some odors. However, construction-related odors would be temporary and would not persist upon project completion. Observation indicates that the project site is not substantially affected by sources of odors, including

existing ferry operations.⁸⁰ During operation, odors would mainly come from diesel powered ferry engines. However, as the proposed project would be subject to strict ferry idling emissions and most of the ferry's operation would be over water, such operations would therefore not create a significant source of new odors. Additionally, Park Service requirements for clean engines will minimize odors as ferry engines run more efficiently and emit less exhaust. Therefore, odor impacts would be less than significant.

Cumulative Air Quality Impacts

Impact C-AQ: The proposed project, in combination with past, present, and reasonably foreseeable future development in the project area would contribute to cumulative air quality impacts. (Less than Significant with Mitigation)

As discussed above, regional air pollution is by its nature largely a cumulative impact. Emissions from past, present, and future projects contribute to the region's adverse air quality on a cumulative basis. No single project by itself would be sufficient in size to result in regional nonattainment of ambient air quality standards. Instead, a project's individual emissions contribute to existing cumulative adverse air quality impacts.⁸¹ The project-level thresholds for criteria air pollutants are based on levels below which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants. Therefore, because the proposed project's construction (Impact AQ-1) and operational (Impact AQ-3) emissions would not exceed the project-level thresholds for criteria air pollutants, the proposed project would not be considered to result in a cumulatively considerable contribution to regional air quality impacts.

As discussed above, the project site is located in an area that already experiences poor air quality. The proposed project would add temporary emissions of diesel particulate matter during construction and would add new ferry trips, vehicle trips, and an emergency generator within an area already adversely affected by air quality which has the potential to contribute to cumulative air quality impacts. However, the proposed project would implement Tier 4 engines in accordance with **Improvement Measure I-AQ-1a, Use Cleaner Construction Equipment**, and **I-AQ-1b, Use Cleaner Engines on Tugboats**, thereby reducing construction period emissions by up to 90 percent, and adhere to Park Service ferry requirements, which would reduce ferry emissions below baseline levels. **Mitigation Measure M-AQ-4, Best Available Control Technology for Diesel Generators at Pier 31½**, which requires best available control technology to limit emissions from the project's emergency back-up generator, would ensure that the proposed project would not expose sensitive receptors to substantial pollutant concentrations. Therefore, the proposed project would not contribute considerably to cumulative air quality impacts.

⁸⁰ Observations based on Anchor QEA staff site visit.

⁸¹ Bay Area Air Quality Management District, *CEQA Air Quality Guidelines*, p. 2-1, May 2011.

<i>Topics:</i>	<i>Potentially Significant Impact</i>	<i>Less Than Significant with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>	<i>Not Applicable</i>
8. GREENHOUSE GAS EMISSIONS— Would the project:					
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Greenhouse gas emissions and global climate change represent cumulative impacts. Greenhouse gas emissions cumulatively contribute to the significant adverse environmental impacts of global climate change. No single project could generate enough greenhouse gas emissions to noticeably change the global average temperature; instead, the combination of greenhouse gas emissions from past, present, and future projects have contributed and will continue to contribute to global climate change and its associated environmental impacts.

The Bay Area Air Quality Management District has prepared guidelines and methodologies for analyzing greenhouse gases. These guidelines are consistent with CEQA Guidelines Sections 15064.4 and 15183.5, which address the analysis and determination of significant impacts from a proposed project's greenhouse gas emissions. CEQA Guidelines Section 15064.4 allows lead agencies to rely on a qualitative analysis to describe greenhouse gas emissions resulting from a project. CEQA Guidelines Section 15183.5 allows for public agencies to analyze and mitigate greenhouse gas emissions as part of a larger plan for the reduction of greenhouse gases and describes the required contents of such a plan. Accordingly, San Francisco has prepared *Strategies to Address Greenhouse Gas Emissions in San Francisco*,⁸² which presents a comprehensive assessment of policies, programs, and ordinances that collectively represent San Francisco's qualified greenhouse gas reduction strategy in compliance with the CEQA guidelines. These greenhouse gas reduction actions have resulted in a 28 percent reduction in greenhouse gas emissions in 2015 compared to 1990 levels,⁸³ exceeding the year 2020 reduction goals outlined in the air district's 2017 Clean Air Plan, Executive Order S-3-05, and Assembly Bill 32 (also known as the Global Warming Solutions Act).⁸⁴

⁸² San Francisco Planning Department, *Strategies to Address Greenhouse Gas Emissions in San Francisco*, 2017. Available from <http://sf-planning.org/strategies-address-greenhouse-gas-emissions>.

⁸³ San Francisco Department of the Environment, *San Francisco's Carbon Footprint*. Available from <https://sfenvironment.org/carbon-footprint>, accessed July 19, 2017.

⁸⁴ Executive Order S-3-05, Assembly Bill 32, and the air district's 2017 Clean Air Plan (continuing the trajectory set in the 2010 Clean Air Plan) set a target of reducing greenhouse gas emissions to below 1990 levels by year 2020.

The Port of San Francisco prepared a *Climate Action Plan*⁸⁵ for fiscal year 2012-2013. The plan focuses on reducing greenhouse gas emissions from internal port operations and does not include prescriptive tenant measures. However, the Port's *Green Building Standards Code*⁸⁶ includes green building practices designed to reduce the greenhouse gas emissions in the City and County of San Francisco to a level 25 percent below 1990 levels by the year 2017, as stated in Board of Supervisors Resolution No. 158-02 and San Francisco Environment Code Chapter 9.

Given that the City has met the state and region's 2020 greenhouse gas reduction targets and San Francisco's greenhouse gas reduction goals are consistent with, or more aggressive than, the long-term goals established under order S-3-05^{87,88}, order B-30-15,^{89,90,91} and Senate Bill 32,^{92,93} the City's greenhouse gas reduction goals are consistent with order S-3-05, order B-30-15, Assembly Bill 32, Senate Bill 32 and the 2017 Clean Air Plan. Therefore, proposed projects that are consistent with the City's greenhouse gas reduction strategy would be consistent with the aforementioned greenhouse gas reduction goals, would not conflict with these plans or result in significant greenhouse gas emissions, and would therefore not exceed San Francisco's applicable greenhouse gas threshold of significance.

The following analysis of the proposed project's impact on climate change focuses on the proposed project's contribution to cumulatively significant greenhouse gas emissions. Because no individual project could emit greenhouse gases at a level that could result in a significant impact on the global

⁸⁶ Port of San Francisco, *Green Building Standards Code*, approved 2016, updated 2017. Available from <http://sfport.com/sites/default/files/Business/Docs/Permit%20Services/2016%20Port%20Building%20Codes/2016%20Port%20Green%20Building%20Code-Revised%20May%202017-Publish.pdf>.

⁸⁷ Office of the Governor, Executive Order S-3-05, June 1, 2005, accessed March 16, 2016. Available from <http://www.pcl.org/projects/2008symposium/proceedings/Coatsworth12.pdf>, accessed March 16, 2016.

⁸⁸ Executive Order S-3-05 sets forth a series of target dates by which statewide emissions of greenhouse gases need to be progressively reduced, as follows: by 2010, reduce greenhouse gas emissions to 2000 levels (approximately 457 million metric tons of carbon dioxide equivalents [MTCO₂E]); by 2020, reduce emissions to 1990 levels (approximately 427 million MTCO₂E); and by 2050 reduce emissions to 80 percent below 1990 levels (approximately 85 million MTCO₂E). Because of the differential heat absorption potential of various greenhouse gases, greenhouse gas emissions are frequently measured in "carbon dioxide-equivalents," which present a weighted average based on each gas's heat absorption (or "global warming") potential.

⁸⁹ Office of the Governor, *Executive Order B-30-15*, April 29, 2015, accessed March 3, 2016. Available from <https://www.gov.ca.gov/news.php?id=18938>.

⁹⁰ Executive Order B-30-15, issued on April 29, 2015, sets forth a target of reducing greenhouse gas emissions to 40 percent below 1990 levels by 2030 (estimated at 2.9 million MTCO₂E).

⁹¹ San Francisco's greenhouse gas reduction goals are codified in Section 902 of the Environment Code and include: i) by 2008, determine City greenhouse gas emissions for year 1990; ii) by 2017, reduce greenhouse gas emissions by 25 percent below 1990 levels; iii) by 2025, reduce greenhouse gas emissions by 40 percent below 1990 levels; and iv) by 2050, reduce greenhouse gas emissions by 80 percent below 1990 levels.

⁹² Senate Bill 32 amends California Health and Safety Code Division 25.5 (also known as the California Global Warming Solutions Act of 2006) by adding Section 38566, which directs that statewide greenhouse gas emissions to be reduced by 40 percent below 1990 levels by 2030.

⁹³ Senate Bill 32 was paired with Assembly Bill 197, which would modify the structure of the State Air Resources Board; institute requirements for the disclosure of greenhouse gas emissions, criteria pollutants, and toxic air contaminants; and establish requirements for the review and adoption of rules, regulations, and measures for the reduction of greenhouse gas emissions.

climate, this analysis is in a cumulative context, and this section does not include an individual project-specific impact statement.

Impact C-GG-1: The proposed project would generate greenhouse gas emissions, but not at levels that would result in a significant impact on the environment or conflict with any policy, plan, or regulation adopted for the purpose of reducing greenhouse gas emissions. (Less than Significant)

Individual projects contribute to the cumulative effects of climate change by directly or indirectly emitting greenhouse gases during construction and operational phases. Direct operational emissions include greenhouse gas emissions from new vehicle and ferry trips and area sources (natural gas combustion). Indirect emissions include emissions from electricity providers; energy required to pump, treat, and convey water; and emissions associated with waste removal, disposal, and landfill operations.

As discussed in the Project Description, the proposed project would increase the number of annual ferry trips, expand visitor facilities, and result in limited new vehicle trips at Pier 31½. Therefore, the proposed project would contribute to annual long-term increases in greenhouse gases as a result of increased ferry and vehicle trips (mobile sources) and commercial operations that result in an increase in energy use, water use, wastewater treatment, and solid waste disposal. Construction activities at both Pier 31½ and Fort Baker would also result in temporary increases in greenhouse gas emissions. The proposed project's greenhouse gas emissions are presented in Table 29.

**TABLE 29
GREENHOUSE GAS EMISSIONS AT PIER 31½ AND FORT BAKER**

Year	CO ₂ E (mt _y)
Construction	
Pier 31½ Construction 2019	28
Pier 31½ Construction 2020	79
Pier 31½ Construction 2021	104
Fort Baker Construction 2023	344
Operation	
2016 CEQA Baseline	1,924
2026 Total	2157
2026 CEQA Increment (Project minus baseline)	232
2035 Total	2115
2035 CEQA Increment (Project minus baseline)	191

Notes:

Pier 31½ construction emissions reflect City of San Francisco's Clean Construction Ordinance. Operational emissions reflect the increment between future emissions and the 2016 baseline emissions and include ferry upgrades as project conditions.

CEQA: California Environmental Quality Act

CO₂E: carbon dioxide equivalent

mt_y: metric tons per year

Source: Anchor QEA, *Air Quality and Greenhouse Gas Technical Report*, Alcatraz Ferry Embarkation Project, Case No. 2017-000188ENV, December 2017.

While greenhouse gas emissions are cumulative in nature, the emissions originating within the City's limits would be subject to different regulations than those outside. Construction would occur at both Pier 31½ and Fort Baker. Mobile source emissions, which represent the bulk of operational greenhouse gas emissions, would, however, all originate from the Pier 31½ site; there would be no new ferry trips or vehicle trips originating from Fort Baker as a result of the proposed project. Therefore, construction at Pier 31½ and the majority of proposed project operations would be subject to regulations adopted to reduce greenhouse gas emissions as identified in the City's greenhouse gas reduction strategy.

Pier 31½

As discussed below, compliance with the applicable regulations would reduce greenhouse gas emissions at Pier 31½ related to transportation, energy use, and waste disposal. Compliance with the City's Commuter Benefits Program, Emergency Ride Home Program, transportation management programs, and bicycle parking requirements would reduce the proposed project's transportation-related emissions. These regulations reduce greenhouse gas emissions from single-occupancy vehicles by promoting the use of alternative transportation modes with zero or lower greenhouse gas emissions on a per capita basis.

The proposed project would be required to comply with the energy efficiency requirements of the Port's Green Building Code and the City's Environment Code, Stormwater Management Ordinance, Water Conservation and Irrigation ordinances, which would promote energy and water efficiency, thereby reducing the proposed project's energy-related greenhouse gas emissions.⁹⁴ Additionally, the proposed project would be required to meet the renewable energy criteria of the Green Building Code, further reducing its energy-related greenhouse gas emissions.

The proposed project's waste-related emissions would be reduced through compliance with the City's Recycling and Composting Ordinance, Construction and Demolition Debris Recovery Ordinance, and Green Building Code requirements. These regulations reduce the amount of materials sent to a landfill, reducing greenhouse gases emitted by landfill operations. These regulations also promote reuse of materials, conserving their embodied energy⁹⁵ and reducing the energy required to produce new materials. Thus, the proposed project components at Pier 31½ were determined to be consistent with San Francisco's greenhouse gas reduction strategy.⁹⁶

The project proponent is required to comply with these regulations, which have proven effective, as San Francisco's greenhouse gas emissions have measurably decreased when compared to 1990 emissions levels, demonstrating that the City has met and exceeded Executive Order S-3-05, Assembly Bill 32, and the 2017 Clean Air Plan greenhouse gas reduction goals for the year 2020. Furthermore, the City has met

⁹⁴ Compliance with water conservation measures reduces the energy (and greenhouse gas emissions) required to convey, pump, and treat water required for the proposed project.

⁹⁵ Embodied energy is the total energy required for the extraction, processing, manufacture, and delivery of building materials to the building site.

⁹⁶ San Francisco Planning Department, *Greenhouse Gas Analysis: Compliance Checklist for Alcatraz Ferry Embarkation Project*, November 22, 2017.

its 2017 goal of reducing greenhouse gas emissions to 25 percent below 1990 levels by 2017. Other existing regulations, such as those implemented through Assembly Bill 32, will continue to reduce projects' contribution to climate change. In addition, San Francisco's local greenhouse gas reduction targets are consistent with the long-term greenhouse gas reduction goals of Executive Order S-3-05, Executive Order B-30-15, Assembly Bill 32, Senate Bill 32 and the 2017 Clean Air Plan. Therefore, because the proposed project elements in San Francisco are consistent with the City's greenhouse gas reduction strategy, it is also consistent with the greenhouse gas reduction goals of Executive Order S-3-05, Executive Order B-30-15, Assembly Bill 32, Senate Bill 32 and the 2017 Clean Air Plan, would not conflict with these plans, and would therefore not exceed San Francisco's applicable greenhouse gas threshold of significance.

Fort Baker

Fort Baker greenhouse gas emissions would be subject to air district thresholds. In May 2017, the air district released new CEQA thresholds, including a greenhouse gas threshold.⁹⁷ For land use development projects, the threshold is compliance with a qualified Greenhouse Gas Reduction Strategy or annual emissions less than 1,100 metric tons per year of CO₂. Land use development projects include residential, commercial, industrial, and public land uses and facilities. As shown in Table 29, greenhouse gas emissions at Fort Baker would be well under the 1,100 metric tons per year threshold.

As such, the proposed project would result in less-than-significant impacts with respect to greenhouse gas emissions. No mitigation measures are necessary.

Topics:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact	Not Applicable
9. WIND AND SHADOW—Would the project:					
a) Alter wind in a manner that substantially affects public areas?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Create new shadow in a manner that substantially affects outdoor recreation facilities or other public areas?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Impact WS-1: The proposed project would not alter wind in a manner that substantially affects public areas. (Less than Significant)

At the Pier 31½ site, the proposed project would construct two new canopies to replace the existing single canopy and provide improved weather protection to visitors. One canopy would cover the primary visitor queuing area, and the other would cover a secondary queuing area and cluster of outdoor tables

⁹⁷ Bay Area Air Quality Management District, *Bay Area Air Quality Management District 2017 CEQA Guidelines Update*, May 2017. Available from http://www.baaqmd.gov/-/media/files/planning-and-research/ceqa/ceqa_guidelines_may2017-pdf.pdf?la=en.

closer to the food service and restrooms. The site is relatively enclosed by the adjacent Pier 31 and 33 sheds and bulkhead buildings. No height or bulk changes to the existing Pier 31 or 33 buildings are proposed as part of the proposed project. The canopies would slope in height (see Figure 12), and would range from 5 to 15 feet lower in elevation than the adjacent pier buildings. For these reasons, these canopies would have little effect on wind patterns in the vicinity of the site. Other changes to the site, such as informational displays and seating, would not be expected to affect wind patterns due to their low height. The proposed project would not install structures or remove trees at the Fort Baker site. For these reasons, impacts from altering wind in a manner that substantially affects public areas would be less than significant.

Impact WS-2: The proposed project would not create new shadow in a manner that substantially affects outdoor recreation facilities or other public areas. (Less than Significant)

The proposed project would involve construction of two canopies (one new net canopy) to cover visitor queuing and eating areas at the Pier 31½ site. The two canopies would cover a relatively small portion of the site, and the remainder of the outdoor site would be open areas. The canopies would not cause new shadows that would negatively affect the use and enjoyment of the outdoor public areas. The proposed project would not install any structures that would cause new shadows at the Fort Baker site. For these reasons, impacts from creating new shadows in a manner that substantially affects public areas would be less than significant.

Impact C-WS: The proposed project, in combination with other past, present, and reasonably foreseeable projects, would not result in cumulatively considerable impacts related to wind and shadow. (Less than Significant)

Wind and shadow effects are highly localized. The geographic scope of potential cumulative wind and shadow impacts on public areas is limited to public areas in the vicinity of the proposed project sites. There are no potential cumulative projects in the vicinity of the proposed project sites listed in Table 6 that could affect wind and shadow. Therefore, the proposed project, in combination with other reasonably foreseeable projects, would not result in significant cumulative wind and shadow impacts.

<i>Topics:</i>	<i>Potentially Significant Impact</i>	<i>Less Than Significant with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>	<i>Not Applicable</i>
10. RECREATION—Would the project:					
a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facilities would occur or be accelerated?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Impact RE-1: The proposed project would not result in a substantial increase in the use of existing parks and recreational facilities or the deterioration of such facilities. (Less than Significant)

A project could increase the use of existing neighborhood and regional parks or other recreational facilities either through population growth, which would increase the overall number of recreational facility users, or by closure of an existing recreational facility, which would displace recreational users to other similar parks or recreational facilities.

The proposed project site at Pier 31½ is located within a tourist district near an existing urban area primarily made up of commercial uses. The area does not contain park facilities, but includes a number of public spaces and recreational facilities related to maritime use, including the existing Alcatraz ferry embarkation site. As discussed in Section E.3, Population and Housing, even without the proposed project, visitation levels to Pier 31½ are expected to increase in future years as a result of management improvements to increase Alcatraz Island’s visitation capacity and a projected increase in tourism in San Francisco. Furthermore, the Park Service is planning for additional capacity to support other interpretative tours, including limited service to Fort Baker. The proposed project improvements would serve to better accommodate those visitors and facilitate visitor loading and unloading, which would reduce possible crowding in the common areas around Pier 31½. There is one park facility within a 0.25-mile radius, the Chestnut and Kearny Open Space; however, this area serves as a natural open space, not as a visitor attraction.

The proposed project would periodically increase visitors to Fort Baker and the Marin Headlands at levels that can be accommodated by existing facilities. Providing limited ferry service between Fort Baker and the primary embarkation site would improve connectivity between and visitor knowledge of the Golden Gate National Recreation Area parklands outside of Alcatraz Island. Visitors arriving by ferry from the primary embarkation site are not expected to leave Fort Baker and nearby parklands so they would not cause an increase in the use of existing parks and recreational facilities in the area. However, even if a portion of ferry passengers visited recreational facilities outside the Golden Gate National Recreation Area, such as those in downtown Sausalito, the increase in use would not be substantial.

Therefore, the proposed project would not result in a substantial increase in the use of existing parks and recreational facilities, or the deterioration of such facilities within the proposed project area, and impacts would be less than significant.

Impact RE-2: The proposed project includes recreational facilities but would not require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment. (Less than Significant)

The proposed project involves the redevelopment of an existing commercial and recreational facility. Improved public amenities at Pier 31½ would include a new ticketing queue and infrastructure, café seating, interpretive displays, a civic plaza, and boat staging. Remodel of the bulkhead buildings would allow for expansion of the basic visitor service program functional area (including a small food service, interpretive retail, restrooms, and operations), and would provide additional and improved orientation and exhibit opportunities for visitors and non-visitors. Additional periodic ferry services to Fort Baker would improve connectivity to and visitor knowledge of the Golden Gate National Recreation Area parklands outside of Alcatraz Island, and would not degrade existing parklands.

The resource topics impact analyses in this Initial Study assess whether the construction and expansion of these existing open space and recreational facilities—the proposed project—would have an adverse physical effect on the environment. Through implementation of the mitigation measures summarized in Section F, Mitigation Measures and Improvement Measures, the proposed project would result in less-than-significant impacts on the environment. Implementation of the improvement measures summarized in that section would further reduce the proposed project’s less-than-significant impacts.

Impact C-RE: The proposed project, in combination with other past, present, or reasonably foreseeable projects, would result in less-than-significant impacts to recreational resources. (Less than Significant)

Cumulative development in the project vicinity would result in an intensification of land uses and a cumulative increase in the demand for recreational facilities and resources, including additional demand for Park Service resources. The City has accounted for such growth as part of the Recreation and Open Space Element of the *San Francisco General Plan*. It is expected that existing recreational facilities in the area would be able to accommodate the increase in demand for recreational resources generated by nearby cumulative development projects. There are no known projects under development within 0.25 mile of Fort Baker. At both the Pier 31½ and Fort Baker sites, the proposed project would help alleviate crowding and enhance recreational activities. For these reasons, the proposed project would not combine with past, present, and reasonably foreseeable future projects in the project vicinity to create a significant cumulative impact on recreational facilities or resources.

<i>Topics:</i>	<i>Potentially Significant Impact</i>	<i>Less Than Significant with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>	<i>Not Applicable</i>
11. UTILITIES AND SERVICE SYSTEMS— Would the project:					
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Have sufficient water supply available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
g) Comply with federal, state, and local statutes and regulations related to solid waste?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Impact UT-1: The proposed project would not exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board. (Less than Significant)

Under existing site operations, wastewater generated by restaurants and restrooms at the Pier 31½ site, sewage from Alcatraz Island (via an onshore pump station), as well as greywater and sewage onboard the ferries, are directed to the San Francisco Public Utilities Commission combined sewer system. Wastewater in the combined sewer system is conveyed to one of three treatment plants in San Francisco: the Oceanside Plant; the Southeast Plant; and the North Point Facility. The Oceanside and Southeast plants operate continuously, while the North Point Facility operates only when it rains. Following treatment, effluent is discharged into either the bay or the Pacific Ocean. Treated solids become biosolids for land application. During prolonged storm events resulting in rainfall that exceeds the system's capacity, water is discharged either into the bay or the Pacific Ocean through one of 36 discharge points.

The proposed project at the Pier 31½ site would not introduce new potential wastewater sources that would substantially change the quality of discharges to the sewer system. Ferries would continue to discharge directly to the system using onboard pumps, similar to baseline conditions. The proposed project would marginally increase demand on restrooms and other wastewater generating facilities, including through the increase in ferry service, although any potential increases in wastewater flows would be offset by new and upgraded water efficient facilities, such as low flow toilets, in compliance with applicable regulations.

Under baseline conditions, sewage from Alcatraz Island is offloaded from barges via pump at Pier 31½. This operation would be discontinued, with sewage offloading moving to another approved facility, which would result in a reduction in discharge to the combined sewer system at Pier 31½.

At the Fort Baker site, portable restrooms maintained by the Park Service are provided to accommodate visitors, and there are no amenities requiring water or wastewater service. Portable restrooms would continue to be maintained under the proposed project; no permanent restrooms are proposed as part of the proposed project. In addition, there would be no pump-out facilities for ferries at Fort Baker. For these reasons, the proposed project would not exceed the wastewater treatment requirements of the applicable Regional Water Quality Control Board, and this impact would be less than significant.

Impact UT-2: The proposed project would not require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects (Less than Significant)

At the Pier 31½ site, amenities requiring water and wastewater service include restrooms and restaurants. Water and wastewater hookups are also provided to ferries operating on site. The proposed project may include water and sewer lateral connections to existing Port or San Francisco Public Utilities Commission infrastructure on or adjacent to the project site. At the Fort Baker site, portable restrooms maintained by the Park Service are provided to accommodate visitors, and no new amenities are planned for the ferry service that would require water or wastewater service. Given the presence of adequate existing water and wastewater treatment infrastructure, and the proposed project's limited effect on water demand or wastewater generation, the proposed project would not require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, and impacts would be less than significant.

Impact UT-3: The proposed project would not require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects. (Less than Significant)

Stormwater runoff from the Pier 31½ site exterior areas is discharged directly into the bay. The proposed project would improve the existing on-site stormwater drainage system to accommodate the proposed improvements and provide lateral connections to the San Francisco Public Utilities Commission combined sewer system, if required. Improvements to the collection and treatment of stormwater would

be evaluated through development of a Stormwater Control Plan in compliance with the City's 2016 Stormwater Management Requirements and Design Guidelines.⁹⁸ Although the proposed project includes resurfacing at Pier 31½, the entirety of the existing site is developed with impervious surfaces. Therefore, the proposed resurfacing would not increase the volume of stormwater runoff.

At Fort Baker, stormwater is currently conveyed via a trunkline system consisting of catch basins, pipes, and concrete-lined swales. Stormwater is gathered and conveyed via gravity flow to four major storm drain outfalls along the seawall at Horseshoe Bay.⁹⁹ The proposed gravel trail would have a negligible effect on impervious surfaces and no new storm water drainage facilities or expansion of existing facilities serving Fort Baker would be required.

For these reasons, the proposed project would have less-than-significant impacts related to construction of new storm water drainage facilities or expansion of existing facilities.

Impact UT-4: The proposed project would have sufficient water supply available to serve the project from existing entitlements and resources. (Less than Significant)

The San Francisco Public Utilities Commission provides water to the Pier 31½ site and throughout San Francisco. In May 2013, the public utility commission updated citywide water supply and demand projections with the *2013 Water Availability Study for the City and County of San Francisco*.¹⁰⁰ According to the study, the San Francisco Public Utilities Commission can meet the current and future water demand in years of average or above-average precipitation, and in single-dry-year and multiple-dry-year events. Study water demand estimates are made in consideration of expected growth in business and industry.

The proposed project may result in a slight increase in operational demand for water supply-dependent services at the Pier 31½ site, which could be accommodated through existing water supplies. Although the increased numbers of visitors to the site would marginally increase demand on water supply-dependent services such as restrooms, the effect on water supply demand would be negligible.

Providing limited ferry service to Fort Baker would have no effect on water supply demands, as visitors would be accommodated by existing or additional portable restrooms. No new amenities are being constructed as part of the proposed project other than the pier improvements, dock, and the trail.

In consideration of the proposed project's anticipated water demands and the study water demand predictions, the proposed project would have a less-than-significant impact on existing water supply entitlements and resources.

⁹⁹ National Park Service, *Fort Baker Plan Final Environmental Impact Statement*, October 1999. Available from <http://parkplanning.nps.gov/document.cfm?parkID=303&projectID=20244&documentID=20847>.

¹⁰⁰ San Francisco Public Utilities Commission, *2013 Water Availability Study for the City and County of San Francisco*, May 2013. Available from <http://www.sfwater.org/modules/showdocument.aspx?documentid=4168>.

Impact UT-5: The proposed project would not result in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments. (Less than Significant)

As described under Impact UT-1, both the Pier 31½ and Fort Baker sites are adequately served by existing wastewater infrastructure. At the Pier 31½ site, the effect of increased visitation on wastewater generation would be diminished by complying with applicable regulations, including plans to modernize existing facilities. For the Fort Baker site, wastewater treatment requirements by visitors using the limited ferry service would be accommodated by existing or additional portable restrooms to be maintained by the Park Service. Therefore, there would be a less-than-significant impact on wastewater treatment providers' ability to accommodate the proposed project and existing commitments.

Impact UT-6: The proposed project would be served by landfills with sufficient permitted capacity to accommodate the project's solid waste disposal needs. (Less than Significant)

Solid waste collection and disposal services in San Francisco, including at Pier 31½, are provided by Recology San Francisco. As of late 2016, solid waste that cannot be recycled, composted, or reused is disposed of at Recology's Hay Road Landfill in Vacaville. Bay Cities Refuse provides solid waste collection within unincorporated southern Marin, including Fort Baker. The majority of solid waste in Marin County is sent to Redwood Sanitary Landfill. The county recently approved an expansion of the landfill to allow operation through 2024.¹⁰¹ The average annual use and average annual capacities of Hay Road and Redwood Sanitary landfills are presented in Table 30.

**TABLE 30
HAY ROAD AND REDWOOD SANITARY LANDFILLS THROUGHPUT AND CAPACITY**

Activity	Average Annual Throughput (tons per year)	Average Annual Capacity (tons per year)
Hay Road Landfill		
Beneficial Reuse	250 to 499	50,000 to 99,999
Solid Waste Disposal (Landfill)	250,000 to 374,999	750,000 to 999,999
Redwood Sanitary Landfill		
Beneficial Reuse	250 to 499	50,000 to 99,999
Solid Waste Disposal (Landfill)	250,000 to 374,999	750,000 to 999,999

Source: California Department of Resources Recycling and Recovery, Facility Information Toolbox (FacIT), Facility Operations: Recology Hay Road Landfill, Inc. (B + J Landfill), 2017.

¹⁰¹ Marin County Community Development Agency, *Marin Countywide Plan Geology, Mineral Resources and Hazardous Materials Technical Background Report*, November 2005. Available from http://www.marincounty.org/~media/files/departments/cd/planning/currentplanning/publications/county-wide-plan/background-reports/geology_background_report.pdf.

As shown in Table 30, Hay Road and Redwood Sanitary landfills are operating well below their average annual capacity. Projections for the region and state also show sufficient existing landfill capacity. As determined by the California Department of Resources Recycling and Recovery, there is an estimated 44 years of remaining landfill space serving the Bay Area region projected through a *business-as-usual* scenario using the current rate of disposal. Although the department does not provide estimates on a regional basis, there is estimated to be 26 years of remaining landfill capacity for the state under a “High Disposal Scenario” or “Economic Boom Scenario,” and 67 years of capacity under a “Low Disposal Scenario” or “Meets 75 Percent Goal Scenario.”¹⁰²

While the proposed project operations may slightly increase solid waste generation above existing levels, landfills serving the area have sufficient capacity to accommodate this change. Existing landfills also have sufficient capacity to accommodate debris generated during demolition and construction. Therefore, there would be a less-than-significant impact related to exceeding landfill capacities.

Impact UT-7: The proposed project would comply with federal, state, and local statutes and regulations related to solid waste. (Less than Significant)

The proposed project would comply with all applicable state and local statutes and regulations associated with operational and construction-related solid waste at both the Pier 31½ and Fort Baker sites. Proposed project operations at Pier 31½ would be subject to San Francisco’s Mandatory Recycling and Composting Ordinance (City Ordinance 100-09), which requires all San Francisco residents and commercial landlords to separate their refuse into recyclables, compostables, and trash, thereby minimizing solid waste disposal and maximizing recycling. Construction at Pier 31½ would be subject to the Port’s Green Building Code, which requires all construction and demolition debris to be transported to a registered facility that can divert a minimum of 75 percent of the material from landfills. Solid waste collection would continue to be managed by the Park Service at the Fort Baker site. Therefore, the proposed project would comply with federal, state, and local statutes and regulations related to solid waste, and this impact would be less than significant.

Impact C-UT: The proposed project would not make a considerable contribution to any cumulative significant effects related to utilities or service systems. (Less than Significant)

The geographic scope for potential cumulative utilities and service systems impacts consists of the service areas of the regional utility providers in San Francisco and Marin counties. A number of landfills are located within 100 miles that could be used by the cumulative projects listed in Table 6, as well as by a wide variety of additional users. The proposed project would result in less-than-significant impacts on water and wastewater service providers and landfill capacity.

¹⁰² California Department of Resources Recycling and Recovery, *State of Disposal in California*, 2016.

The proposed project, along with other cumulative projects, would incrementally increase demand on utilities and service systems at both sites, but not beyond levels anticipated and planned for by public service providers in existing service management plan areas. Most of the cumulative projects would dispose of construction debris at available landfills, which would contribute to potential impacts on available landfill capacity. As discussed above under Impact UT-3, there is adequate landfill capacity in the Bay Area region for an estimated 44 years. For these reasons, the proposed project would not combine with past, present, and reasonably foreseeable future projects in the region to create a significant impact on utilities and service systems. Impacts would be less than significant.

<i>Topics:</i>	<i>Potentially Significant Impact</i>	<i>Less Than Significant with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>	<i>Not Applicable</i>
12. PUBLIC SERVICES— Would the project:					
a) Result in substantial adverse physical impacts associated with the provision of, or the need for, new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any public services such as fire protection, police protection, schools, parks, or other services?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Impact PS-1: The proposed project would not result in an increase in demand for police protection, fire protection, schools, or other services to an extent that would result in substantial adverse physical impacts associated with the construction or alteration of governmental facilities. (Less than Significant)

The existing and proposed Alcatraz embarkation facility at Pier 31½ receives fire protection and emergency medical services from the San Francisco Fire Department's Fire Station 28 located at 1814 Stockton Street, approximately 0.35 mile from the site, and police protection services from the San Francisco Police Department's Central Station located at 766 Vallejo Street, approximately 0.7 mile southeast of the site. As discussed in Section E.3, Population and Housing, the proposed project would not result in population changes or increased housing needs. While designed to accommodate projected growth in tourism to San Francisco, the proposed project itself would not be growth-inducing. Regardless, the projected growth in visitors to the site would not substantially increase the demand for police protection, fire protection, schools, parks, or other services.

The proposed project site at Fort Baker would continue to be served by the Southern Marin Fire Protection District, U.S. Park Police, Park Service Rangers, and the U.S. Coast Guard. Providing limited ferry service to Fort Baker is expected to result in a negligible increase in demand for these services. Any

increased demand for public services associated with this component of the proposed project is expected to be minimal and adequately served by existing services.

For the reasons noted above, the impacts of the proposed project on public services would be less than significant.

Impact C-PS: The proposed project, combined with past, present, and reasonably foreseeable future projects in the vicinity, would not result in significant physical impacts on the environment associated with the construction or alteration of public service facilities. (Less than Significant Impact)

Cumulative development in the project vicinity would result in an intensification of land uses and a cumulative increase in the demand for fire protection, police protection, school services, and other public services. The Fire Department, the Police Department, the San Francisco Unified School District, and other City agencies have accounted for such growth in providing public services to the residents of San Francisco. In addition, for those cumulative projects that may increase the demand for public services in the vicinity of the Pier 31½ proposed project site, the City has enacted development impact fees to expand services, any of which that would require physical upgrades would also be subject to individual CEQA analysis. There are no known projects under development within 0.25 mile of Fort Baker. For these reasons, the proposed project would not combine with past, present, and reasonably foreseeable future projects in the project vicinity to create a significant cumulative impact on public services.

<i>Topics:</i>	<i>Potentially Significant Impact</i>	<i>Less Than Significant with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>	<i>Not Applicable</i>
13. BIOLOGICAL RESOURCES— Would the project:					
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Topics:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact	Not Applicable
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Aquatic Biological Resources

Setting

The aquatic biological resources study area includes the in-water footprint of the proposed project, including immediately adjacent marine areas that could be indirectly affected by construction or operations. The Pier 31½ site includes the shoreline along the northeastern San Francisco waterfront, while the Fort Baker site includes the shoreline along the southern waterfront of Marin County. The study area related to underwater sound pressure (noise) impacts includes the in-water area that could be affected by noise during pile driving, which was estimated through bioacoustics noise modeling conducted during the Endangered Species Act consultation with the National Marine Fisheries Service as memorialized in the Biological Opinion prepared for the proposed project^{103, 104}. This distance is inclusive of areas where pile driving may result in increased turbidity.

General Habitat Conditions

Aquatic habitat at the Pier 31½ and Fort Baker study areas are representative of species assemblages at pier locations throughout the Central Bay, and includes benthic fauna, encrusting organisms, aquatic vegetation, planktonic organisms, fish, and marine mammals. Marine habitats along the northeastern San Francisco waterfront include intertidal, subtidal, and open water.

The study area at Pier 31½ is developed with piers and hard armoring. Marine habitats and associated communities present in these areas include artificial intertidal structures (e.g., pilings and seawalls),

¹⁰³ National Marine Fisheries Service, Endangered Species Act Section 7(a)(2) Biological Opinion and Magnuson-Stevens Fishery Conservation and Management Act Essential Fish Habitat Response for the Alcatraz Ferry Embarkation Project (NPS File No. L76 [GOGA-PL]), October 3, 2017.

¹⁰⁴ National Park Service, Response to Non-Concurrence Letter and Request for Additional Information for the Alcatraz Ferry Embarkation Project, National Marine Fisheries Service WCR-2016-5894L76, March 3, 2017.

substrate and benthos, and open water. No natural undisturbed shorelines exist in the vicinity of the Pier 31½ site.

The study area at Fort Baker primarily includes the existing pier structure, which provides habitat to encrusting organisms within the intertidal zone, and adjacent open waters. Neighboring Horseshoe Bay also contains sandy-gravel beaches and rocky intertidal habitats, and an offshore population of eelgrass.^{105,106}

Special Aquatic Sites

Certain waters of the United States that are recognized as having unique ecological value have been designated “special aquatic sites.” This includes sanctuaries and refuges, mudflats, wetlands, vegetated shallows, eelgrass bed, coral reefs, and riffle and pool complexes. Special aquatic sites may be afforded additional protection or consideration under federal regulations. Within the Central Bay, two unique natural communities are considered special aquatic sites: eelgrass beds and native oyster beds.

Eelgrass has been afforded special management considerations by the California Department of Fish and Wildlife, U.S. Fish and Wildlife Service, National Marine Fisheries Service, U.S. Environmental Protection Agency, San Francisco Bay Conservation and Development Commission, and the Golden Gate Audubon Society. The National Marine Fisheries Service considers eelgrass beds to be a habitat area of particular concern. Eelgrass commonly inhabits shallow, soft-bottom substrates of bays and estuaries throughout the California coast. Eelgrass beds often accrete sediments and function ecologically as substrate for epifauna and nursery habitat for juvenile fish. In the bay, eelgrass provides unique biological environments for spawning Pacific herring, and serves as a nursery area for many valued species of fish, including Pacific herring, halibut (*Hippoglossus* spp.), and English sole. Comprehensive eelgrass surveys of the bay were completed as part of a Bay-wide programmatic essential fish habitat consultation for the San Francisco Bay Long-term Management Strategy Program for maintenance dredging. Surveys throughout the bay are also conducted regularly by the California Department of Fish and Wildlife (last updated in 2016). Specific to the shoreline at Fort Baker, eelgrass surveys were completed to support the 1999 Fort Baker Plan Final Environmental Impact Statement. Eelgrass has not been observed at the Pier 31½ site, but was observed within the eastern and northeastern perimeter of Horseshoe Bay approximately 1000-feet from the pier at Fort Baker (Figure 16).^{107,108,109}

Native oyster beds are composed of living Olympia oysters (*Ostrea conchaphila*) and remnant beds composed of dead shell material. Oyster beds form in the subtidal zone, typically bordered by mudflats at higher elevations and eelgrass beds at lower elevations. No live subtidal Olympia oyster beds have been documented at the Pier 31½ or Fort Baker sites in the bay, and neither site has been identified as a priority native oyster restoration site.¹¹⁰ Native oysters have been reported to inhabit intertidal wharf pilings on Port piers, and may be found on pilings within the study area.¹¹¹

Essential Fish Habitat

Essential fish habitat is defined as the specific habitat essential for each life stage of federally-managed species. The Central Bay, including the project sites, is designated essential fish habitat for assorted fish species managed under the Coastal Pelagic, Pacific Groundfish, and Pacific Coast Salmon Fishery Management Plans. The Pacific Coast Groundfish Fishery Management Plan manages at least 89 species over a large, ecologically diverse area covering the entire West Coast of the continental United States; 15 species managed under this Fishery Management Plan have species distributions within the Central Bay. The Coastal Pelagic Species Fishery Management Plan includes five species, three of which have known species distributions in the Central Bay. In addition, the Pacific Coast Salmon Fishery Management Plan includes Chinook salmon and coho salmon, and identifies the entire Bay as essential fish habitat.¹¹² Species for which essential fish habitat has been designated that are likely to exist in the study area are listed in Table 31.

Special Status Species

The California Natural Diversity Database identifies 13 federal Endangered Species Act- or California Endangered Species Act-listed marine species (species listed as candidate special concern, threatened, or endangered pursuant to the Endangered Species Act or the California Endangered Species Act) with recorded occurrences in the vicinity of the study area.¹¹³ These species are listed in Appendix A. Several marine species may be reasonably expected to inhabit the study area based on the presence of suitable habitat. Endangered Species Act- and California Endangered Species Act-listed species with a moderate

¹¹³ California Department of Fish and Wildlife, California Natural Diversity Database and U.S. Fish and Wildlife Service database search of project and surrounding quadrangles: San Francisco North, San Rafael, San Quentin, Richmond, Point Bonita, Oakland West, Hunters Point, and San Francisco South, 2017.

to high potential to inhabit the study area or with critical habitat or essential fish habitat that they depend on in the study area are discussed in further detail as follows.

Chinook salmon. Three Chinook salmon evolutionarily significant units migrate through the northern and central portions of the bay: Sacramento River winter-run, Central Valley spring-run, and Central Valley fall/late fall-run.¹¹⁴ Each evolutionarily significant unit is considered a distinct race and has been given its own management status: the Sacramento River evolutionarily significant unit is state and federally listed as endangered; the Central Valley spring-run is state and federally listed as threatened; and the Central Valley fall/late fall-run is a state and federal species of concern.¹¹⁵

Sacramento River winter-run Chinook salmon migrate and spawn from mid-December to August along the Sacramento River, up to Keswick Dam in Shasta County. Adult winter-run Chinook salmon can be found in the bay in November and December. Central Valley spring-run Chinook salmon have a similar life history, but begin spawning migration to the Delta in late winter to spring. Adults are found in the bay during the migratory period in the spring, and juveniles have the potential to inhabit the bay in the fall, winter, and spring. Critical habitat for Sacramento River winter-run Chinook and Central Valley spring-run Chinook salmon includes all waters of the bay north of the Bay Bridge.¹¹⁶ Adult Central Valley fall-run/late fall-run Chinook salmon begin their migration toward their spawning grounds in June, with a peak in September. They spawn in the Delta in December and January. Juvenile salmon potentially inhabit the bay in the late winter through summer. There is no critical habitat designated for this species.

Coho salmon. Coho salmon are listed as threatened under the Endangered Species Act and endangered under the California Endangered Species Act. Adult coho migrate through the bay after late fall or winter heavy rains to spawn in the Delta. Juvenile coho potentially inhabit the bay in the spring, summer, and fall and may be present in the Central Bay. Critical habitat for Central California Coast coho salmon within the bay includes all waters of the Central Bay north of the Bay Bridge.¹¹⁷

Steelhead trout. Individuals from two steelhead evolutionarily significant units can be found in the bay: central California coast steelhead and Central Valley steelhead. Both evolutionarily significant units are federally listed as threatened, and central California coast steelhead are also a species of special concern.

Central Valley steelhead migrate between the ocean and the Delta and its tributaries via the San Francisco and San Pablo bays. Upstream migration occurs in the winter, with peak spawning occurring from

¹¹⁷ Ibid.

December through April. Central California coast steelhead migrate from the Pacific coast through the bay in the winter to spawn in freshwater in the upper Sacramento River. Critical habitat for central California coast steelhead and Central Valley steelhead occurs in the Central Bay and includes the study area.¹¹⁸

Green sturgeon. Green sturgeon are listed as a federally threatened species and as a state species of concern. Green sturgeon are found throughout the bay and are native to the Sacramento-San Joaquin River system. Spawning occurs in the lower reaches of the Sacramento-San Joaquin River system; however, feeding occurs throughout the bay. Adult green sturgeon migrate into freshwater beginning in late February, with spawning occurring in March through July and peak activity in April and June. After spawning, juveniles remain in fresh and estuarine waters for 1 to 4 years and then begin to migrate out to sea. Critical habitat for green sturgeon occurs within the Central Bay and includes the study area.¹¹⁹

Longfin smelt. Longfin smelt are listed as a state threatened species, and are a candidate for listing under the federal Endangered Species Act. Longfin smelt live in open waters of the Central Bay, including within the study area.¹²⁰ Longfin smelt inhabit Central Bay waters throughout the year, although they migrate to the Delta to spawn in freshwater during the winter. No critical habitat has been designated for this species.

Marine mammals are afforded special regulatory protection under the Marine Mammal Protection Act. The most common marine mammals to inhabit the project sites are Pacific harbor seals (*Phoca vitulina*) and California sea lions (*Zalophus californianus*). Other marine mammal species that occasionally inhabit the bay and could be considered transient visitors include the gray whale (*Eschrichtius robustus*), harbor porpoise (*Phocoena phocoena*), Steller sea lion (*Eumetopias jubatus*), and, less frequently, the southern sea otter (*Enhydra lutris*).¹²¹ On rare occasions, individual humpback whales (*Megaptera novaeangliae*) have entered the bay. Pacific harbor seals are nonmigratory, have limited seasonal movements associated with foraging and breeding activities, and use the bay year-round.¹²² Harbor seals forage in shallow waters on a variety of fish and crustaceans, and therefore, could occasionally be found foraging in Pier 31½ or Fort Baker waters. Harbor seals come ashore (haulout) in groups ranging in size from a few individuals to several hundred. Habitats used as haulout sites include tidal rocks, bayflats, sandbars, and sandy beaches.¹²³ California sea lions breed in Southern California and along the Channel Islands. After the

breeding season, males migrate up the Pacific Coast and enter the bay. Sea lions are known to haul out at Pier 39 in Fisherman's Wharf, which is approximately 0.75 mile west of Pier 31½. During anchovy and herring runs, approximately 400 to 500 sea lions (mostly immature males) feed almost exclusively in the North and Central Bay¹²⁴ and could occasionally forage at Pier 31½ or Fort Baker. Pinnipeds, including California sea lions and harbor seals, may haulout on buoys in the vicinity of Pier 31½, and may use the Fort Baker pier. Other marine mammal species may be infrequent transient visitors at both sites.

Terrestrial Biological Resources

Setting

The terrestrial biological resources study area includes the entire upland footprint of the proposed project at both sites and all areas that may be directly or indirectly affected by the proposed project. Specifically, the study area at the Pier 31½ site includes the Pier 31 and Pier 33 bulkhead buildings, as well as the developed waterfront space between these piers. The study area at the Fort Baker site includes the above-water portions of the pier and the planned trail area.

General Habitat Conditions

Pier 31½ is located in a developed urban area, as characterized using the California Wildlife Habitat Relationship System.¹²⁵ Vegetation is minimal, primarily consisting of ornamental landscaping and scattered trees and bushes in planter boxes. The areas surrounding Pier 31½ are minimally vegetated, with a few landscaped trees and bushes intermittently located along the adjacent promenade.

The Fort Baker Plan EIS¹²⁶ described the vegetation of Cavallo Point and the developed areas of Fort Baker as "Urban/Disturbed" as a result of historic use and landscape plantings. Developed areas of Fort Baker are bordered on three sides by undeveloped lands managed by the Park Service, and by Horseshoe Bay to the south. The hillside immediately west of the pier consists of coastal scrub dominated by coyote brush (*Baccharis pilularis*) and California sagebrush (*Artemisia californica*). Planted stands of Monterey cypress (*Cupressus macrocarpa*) are also located near the pier.¹²⁷

¹²⁷ U.S. Fish and Wildlife Service, Species List Search of Project and Surrounding Quadrangles, <https://ecos.fws.gov/ipac/>, last updated October 11, 2012, accessed March 20, 2013.

Special Status Species

Special status terrestrial species that have been documented in the California Natural Diversity Database search area¹²⁸ are presented in Appendix A, including a description of their habitat associations and potential to inhabit the study area. Most of the species are not expected to inhabit the study area because their required habitat is not present. At the Pier 31½ site, potential presence of special status species is limited to bat species and Migratory Bird Treaty Act-protected birds; these protected bats and birds may also be present at Fort Baker, in addition to the mission blue butterfly (*Icaricia icarioides missionensis*), California least tern (*Sterna antillarum browni*), and American badger (*Taxidea taxus*). These species with potential to occur are discussed further as follows.

Additional California Native Plant Species-ranked plant species are listed in Appendix A. Based on the current habitat conditions and the known range of these species, none of these have potential to inhabit the study area.

Populations of the mission blue butterfly and host species lupine have been recorded at several sites within the Marin Headlands and Fort Baker. While lupine is most commonly associated with coastal chaparral and grasslands, this species could potentially inhabit coastal scrub areas at Fort Baker.¹²⁹ The Park Service conducts annual surveys for the mission blue butterfly, which includes mapping lupine populations. Neither the mission blue butterfly or host lupine species have been recorded during these surveys within coastal scrub in the study area at Fort Baker.¹³⁰

The federal and state endangered California least tern has been observed feeding in Horseshoe Bay.¹³¹ This species is not expected to use the study area as nesting habitat.^{132,133}

Numerous special status bat species are known to inhabit the Bay Area, and may potentially inhabit the vicinity of Fort Baker or Pier 31½. The California Natural Diversity Database lists occurrence of four bat species of special concern within the project and surrounding quadrangles, including the pallid bat (*Antrozous pallidus*), Townsend's big-eared bat, western red bat (*Lasiurus blossevilli*), and big free-tailed bat

¹²⁸ California Department of Fish and Wildlife, California Natural Diversity Database and U.S. Fish and Wildlife Service database search of project and surrounding quadrangles: San Francisco North, San Rafael, San Quentin, Richmond, Point Bonita, Oakland West, Hunters Point, and San Francisco South, 2017.

¹³³ California Department of Fish and Wildlife, *California Least Tern Breeding Survey 2015 Season*, 2016.

(*Nyctinomops macrotis*).¹³⁴ Townsend's big-eared bats and pallid bats may roost in abandoned or minimally occupied structures within the study area, western red bats may roost in trees, and big free-tailed bats may roost in trees or buildings.^{135,136} Townsend's big-eared bats have been documented at buildings in the Marin Headlands, and western red bats have been observed in low abundance in San Francisco park and lake areas during 2009 surveys.^{137,138} At Fort Baker, trees and buildings suitable for bat roosting are located away from the pier area. Pier 31½ lacks trees suitable for bat roosting, although bulkhead buildings planned for renovation may provide suitable roosting habitat for Townsend's big-eared bats, pallid bats, big free-tailed bats, or other bat species.

The American badger, a state species of special concern, has been observed at Wolfback Ridge in the vicinity of Fort Baker.¹³⁹ This species is typically associated with open, arid habitats, including grasslands within the Marin Headlands. American badgers may occasionally frequent coastal scrub habitats, possibly including those occurring adjacent to the study area at Fort Baker.

Migratory birds protected under the Migratory Bird Treaty Act may nest in trees, shrubs, or buildings within the Fort Baker or Pier 31½ sites. Trees at Fort Baker may provide nesting or roosting habitat for birds of prey, such as the great horned owl (*Bubo virginianus*), red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*Buteo lineatus*), and Cooper's hawk (*Accipiter cooperii*).¹⁴⁰ In addition, cliff swallows (*Hirundo pyrrhonota*) are known to nest on buildings at Fort Baker.¹⁴¹ All owls, hawks, and swallows are protected by the Migratory Bird Treaty Act. Western and California gulls (*Larus occidentalis* and *Larus californicus*), which are also protected migratory birds, often nest on or under roofs of pier sheds and or pier decks.

There are three special status plant species (California Native Plant Species Rank 1 or 2 species) documented in the California Natural Diversity Database search area covering both the Pier 31½ and Fort Baker project sites: bristly sedge (*Carex comosa*); rose leptosiphon (*Leptosiphon rosaceus*), and beach layia

¹³⁴ California Department of Fish and Wildlife, California Department of Fish and Wildlife Natural Diversity Database search of the San Francisco North, San Rafael, San Quentin, Richmond, Point Bonita, Oakland West, Hunters Point, and San Francisco South USGS Quadrangles, December 30, 2012.

¹⁴¹ National Park Service, *Fort Baker Plan Final Environmental Impact Statement*, October 1999. Available from <http://parkplanning.nps.gov/document.cfm?parkID=303&projectID=20244&documentID=20847>.

(*Layia camosa*).¹⁴² None of these species occur at the Pier 31½ site. Based on historic occurrences in the region and association with habitats at Fort Baker, three additional species are considered to have potential to inhabit the Fort Baker area: San Francisco wallflower (*Erysimum franciscanum*), San Francisco campion (*Silene verecunda* ssp. *verecunda*), and San Francisco lessingia (*Lessingia germanorum*).¹⁴³ Suitable habitat or microhabitat conditions specific to these species do not exist because of long-term disturbances associated with the Fort Baker site. Therefore, these California Native Plant Species-ranked species are unlikely to inhabit the immediate project area.^{144,145}

Impact BI-1: The proposed project could have a substantial adverse effect, either directly or through habitat modifications, on species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service. (Less than Significant with Mitigation)

Managed Fish Species

During construction, increases in underwater sound pressure levels as a result of pile driving may affect fish behavior, or cause injury. Pile driving may also temporarily disturb benthic sediments and increase suspended sediment levels (turbidity) in the immediate vicinity of the project sites during construction. Increased suspended sediment levels and associated loss of benthic or encrusting organisms may temporarily impact foraging opportunities for fish during construction.

Construction underwater noise and increased turbidity effects would be localized and temporary: at Pier 31½, pile driving would occur for a period of up to 6 days (for driving of up to 12 steel piles); and at Fort Baker, pile driving would occur for a period of up to 4 days (for driving up to 8 steel piles). The anticipated pile counts, pile types (size and material), and number of piles to be installed per day as part of the proposed project are identified in Table 32. All piles would be installed via impact hammer, with bubble curtains¹⁴⁶ installed to attenuate underwater sound levels.

¹⁴² California Department of Fish and Game, California Department of Fish and Game Natural Diversity Database search of the San Francisco North, San Rafael, San Quentin, Richmond, Point Bonita, Oakland West, Hunters Point, and San Francisco South USGS Quadrangles, December 30, 2012.

¹⁴³ National Park Service, *Fort Baker Plan Final Environmental Impact Statement*, October 1999. Available from <http://parkplanning.nps.gov/document.cfm?parkID=303&projectID=20244&documentID=20847>.

¹⁴⁴ Ibid.

¹⁴⁵ National Park Service, *Final Environmental Impact Statement for Extension of F-Line Streetcar Service to Fort Mason Center*, Document No. 641/106203a, February 2012.

¹⁴⁶ A bubble curtain is a system set up around a construction activity that produces air bubbles originating from the bottom of the water column. When the bubbles of air (gas) are released, they act as a barrier (a curtain) breaking sound propagating through water due to the difference in density between air and water.

TABLE 32
PROPOSED PROJECT PILE DETAILS

Project Site	Pile Diameter (inches)	Pile Type	Number of New Permanent Piles ¹	Piles Installed per Day ²
Pier 31½	36	Steel	8	2-3
	24	Steel	4	2-3
Fort Baker	30 (for gangway landing)	Steel filled with concrete	4	2-3
	36 (for float)	Steel	4	2-3

1. Pile counts are approximate, based on preliminary designs and substrate conditions.
2. All piles to be installed via impact hammer with bubble curtain.

As described above, listed salmonids, including central California coast evolutionarily significant unit Coho salmon, central California coast distinct population segment steelhead trout, Central Valley distinct population segment steelhead trout, Sacramento River winter-run evolutionarily significant unit Chinook salmon, and Central Valley spring-run evolutionarily significant unit Chinook salmon, are seasonally present in the bay. Green sturgeon southern distinct population segment and longfin smelt are year-round residents in the San Francisco Bay, and may be present in the project area during construction. However, tagging studies on green sturgeon in the bay suggest that green sturgeon do not typically occur in areas along the waterfront for more than minutes to hours at a time,¹⁴⁷ and the project area lacks the quality forage and cover favored by green sturgeon. Longfin smelt are primarily present in the central Bay during the late summer months before migrating upstream in fall and winter.

If they are locally present during the short duration of activities (up to 6 days at Pier 31½ and 4 days at Fort Baker), pile driving may result in impacts to managed fish species. Impacts could include injury, abnormal behavior indicative of stress, or a startle response. Although managed fish species could occur in the vicinity of construction activities, the likelihood of injury or mortality is proportionate to the low likelihood of presence within the project area and the brief duration of construction. These responses are likely to diminish after a few pile strikes, or as fish leave the area.¹⁴⁸ The open water area of the San Francisco Bay surrounding the pile driving area of effect would provide startled fish sufficient area to escape from the area of potential mortality and injury to areas of reduced or eliminated behavioral effects. Therefore, elevated sound levels should not result in significant effects on these individuals. Areas adjacent to pile driving sites provide habitat of similar or higher quality and provide adequate carrying capacity to support individuals that are temporarily displaced during pile driving.

Furthermore, the area around Pier 31½ in particular is subject to ongoing commercial vessel activity, and pile driving would occur within areas already containing substantial solid fill and large numbers of existing piles surrounding the project site. This would serve to further reduce the likelihood of managed

¹⁴⁷ National Marine Fisheries Service, *Biological Opinion for the Downtown San Francisco Ferry Terminal Expansion Project, San Francisco, California*, June 30, 2014.

¹⁴⁸ Ibid.

fish species being present at this site. At Fort Baker, the small number of piles would also be driven adjacent to an existing pier.

Turbidity effects at from pile driving at Pier 31½ and Fort Baker would be short term and minor, as described in Section E.16, Hydrology and Water Quality. Pile driving may temporarily disturb benthic sediments and increase suspended sediment levels in the immediate vicinity of the project site during construction. Increased suspended sediment levels and associated loss of benthic or encrusting organisms may temporarily impact foraging opportunities. Temporary increases in suspended sediment may cause clogging of gills and feeding apparatuses of fish and filter feeders, if present. These impacts would be limited to the very short pile driving construction period. The likelihood of managed fish species' presence within areas affected by pile driving is low, as discussed above, would further encourage fish species to leave the pile driving area. Therefore, managed fish species would experience only negligible effects related to turbidity and suspended sediments.

Thus, based on the low number of piles being driven, the extremely short duration of pile driving activities, ongoing activity at the Pier 31½ site, proximity to existing structures, and use of bubble curtains, the proposed project would have less-than-significant impacts on managed fish species.

The Park Service, as lead federal agency for the proposed project, initiated formal consultation under the Endangered Species Act with the National Marine Fisheries Service during the National Environmental Policy Act process. This consultation concluded on October 3, 2017, with issuance of the Biological Opinion for the proposed project.¹⁴⁹ As part of the Endangered Species Act consultation, bioacoustic noise modeling was performed to assess the potential for the proposed project to cause adverse pile driving noise effects on managed fish species. The results of this evaluation are documented in the Biological Opinion. As part of the consultation, the Park Service agreed to implement additional measures to ensure the effects of pile driving remain less than significant. These are included as the following project improvement measures:

Improvement Measure I-BI-1a: Pile Driving Work Windows

Pile driving will occur between July 1 and November 30 at the Pier 31½ site and between July 1 and September 30 at the Fort Baker site.

¹⁴⁹ National Marine Fisheries Service, Endangered Species Act Section 7(a)(2) Biological Opinion and Magnuson-Stevens Fishery Conservation and Management Act Essential Fish Habitat Response for the Alcatraz Ferry Embarkation Project (NPS File No. L76 [GOGA-PL]), October 3, 2017.

Improvement Measure I-BI-1b: Noise Monitoring Plan

The project proponent will develop and implement a marine noise monitoring plan which would be subject to review and approval by the National Marine Fisheries Service. As part of this plan, the following measures will be implemented:

- *Equipment Controls:* The proposed project will be required to bring loud mechanical equipment online slowly (employ a “soft-start”).
- *Noise Monitoring:* A trained acoustical specialist will conduct underwater noise monitoring during marine construction to ensure that pile driving noise levels do not exceed the levels identified through noise modeling for the proposed project. If noise levels are exceeded, the proposed project will implement cushion blocks in the hammer to reduce sound levels and prevent exceedance of the levels projected through noise modeling, and noise level exceedances will be reported to the National Marine Fisheries Service.

Based on the analysis presented above, impacts on managed fish species due to pile driving would be less than significant. Adherence to **Improvement Measures I-BI-1a, Pile Driving Work Windows**, and **I-BI-1b, Noise Monitoring Plan**, both of which were agreed to by the Park Service in consultation with the National Marine Fisheries Service, would further ensure that effects of pile driving would remain less than significant.

The installation of new docks would result in a small amount of shading over bay waters. Long-term overwater shading from docks and piers has historically been viewed as relatively neutral with respect to fish communities¹⁵⁰; seasonal variance would likely have a much stronger effect on fish community composition compared to relatively minor changes in light gradients from gangways and floats. In-water fill from the proposed project would be minimal, limited to the small area required for additional support piles, floats, and gangways (approximate net fill of 0.06 acre at Pier 31½ and 0.04 acre at Fort Baker). The addition of artificial hard substrates (i.e., new piles) may minimally increase habitat area for encrusting organisms on which fish feed. The project proponent would be required to obtain permits from the U.S. Army Corps of Engineers, Regional Water Quality Control Board, and San Francisco Bay Conservation and Development Commission, and proposed project implementation would proceed in adherence with all conditions from these agencies. Effects to fish from shading and in-water fill, including to green sturgeon and longfin smelt, are therefore expected to be less than significant.

Marine Mammals

Marine mammals have large home range; therefore, they are capable of avoiding use of some areas for short periods of time. Any marine mammals present in the general vicinity of the Pier 31½ and Fort Baker sites during construction would be able to detect the increased underwater sound pressure levels resulting from pile driving, and would be expected to temporarily avoid the construction area. The radii

¹⁵⁰ Naval Facilities Engineering Command and Unified Port of San Diego, *San Diego Bay Integrated Natural Resources Management Plan, Draft*, prepared by Tierra Data, Inc., Escondido, California, November 2011.

of possible impacts are described in full in the proposed project's Biological Opinion. Thus, similar to impacts on managed fish species, due to the extremely short pile driving duration, location of pile driving, low number of piles, and use of bubble curtains, the proposed project would result in less-than-significant impacts to marine mammals.

Bioacoustic noise modeling to evaluate the effects of pile driving on marine mammals was also developed during the Endangered Species Act consultation process. As also described in the Biological Opinion, to further ensure that underwater noise effects remain consistent with the levels anticipated through bioacoustics noise modeling, the project proponent would implement **Improvement Measure I-BI-1c, Marine Mammal Safety Zone**:

Improvement Measure I-BI-1c: Marine Mammal Safety Zone

The project proponent will maintain a 500-meter safety zone around sound sources in the event that the sound level is unknown or cannot be adequately predicted. This will be required at the onset of construction, prior to confirming noise levels through noise monitoring (as required through **Improvement Measure I-BI-1b, Noise Monitoring Plan**).

A qualified marine biologist on shore or by boat will survey the safety zone to ensure that no marine mammals are within the zone before pile driving begins. If a marine mammal is observed within the safety zone before pile driving begins, pile driving will be delayed until the marine mammals move out of the area.

If marine mammals enter the safety zone after pile driving of a segment has begun, pile driving will continue. The biologist will monitor and record the species and number of individuals observed, and make note of their behavior patterns. If the animal appears distressed, and if it is operationally safe to do so, pile driving will cease until the animal leaves the area. Prior to the initiation of each new pile driving episode, the area will again be thoroughly surveyed by the biologist.

Implementation of **Improvement Measure I-BI-1c, Marine Mammal Safety Zone**, would further lessen the proposed project's less-than-significant impacts on marine mammals.

Terrestrial Mammals

At Fort Baker, buildings may provide roosting habitat for Townsend's big-eared bat, pallid bat, and big free-tailed bat; and trees may provide roosting habitat for Western red bat and big free-tailed bat. Fort Baker buildings and trees are located away from the area of direct impact associated with the proposed project, and the proposed project would not result in loss of any potential bat roosting habitat. Indirect construction impacts would largely be limited to noise effects, most significantly from pile driving, which would similarly occur away from building or tree habitat suitable for bat roosting. Furthermore, only Townsend's big-eared bat has any record of occurring within the project site or neighboring areas. Therefore, the proposed project is unlikely to affect any special status bat species potentially present at Fort Baker.

The bulkhead buildings at Pier 31 and Pier 33 within the Pier 31½ site may provide habitat to bat species that roost in buildings, potentially including the Townsend's big-eared bat, pallid bat, and big free-tailed bat. Renovations within the bulkhead buildings could result in direct mortality of special status bats roosting within the project site, if present. This would constitute a significant impact. **Mitigation Measure M-BI-1a, Avoidance and Minimization Measures for Special Status Bats at Pier 31½**, would be implemented to reduce impacts.

Mitigation Measure M-BI-1a: Avoidance and Minimization Measures for Special Status Bats at Pier 31½

The project proponent will implement the following measures:

- Demolition within Pier 31 and 33 bulkhead buildings shall occur when bats are active, approximately between the periods of March 1 to April 15 and August 15 to October 15; outside of bat maternity roosting season (approximately April 15 – August 15) and outside of months of winter torpor (approximately October 15 – February 28), to the extent feasible.
- If demolition within Pier 31 and 33 bulkhead buildings during the periods when bats are active is not feasible, a qualified biologist will survey the project site to identify if active bat roosts being used for maternity or hibernation purposes are present. If so, a no disturbance buffer of 100 feet shall be established around these roost sites until they are determined to be no longer active by the qualified biologist.
- The qualified biologist shall be present demolition within Pier 31 and 33 bulkhead buildings if active bat roosts are present. Structures with active roosts shall be disturbed only when no rain is occurring or is forecast to occur for 3 days and when daytime temperatures are at least 50°F.
- Removal of structures containing or suspected to contain active bat roosts shall be dismantled under the supervision of the qualified biologist in the evening and after bats have emerged from the roost to forage. Structures shall be partially dismantled to significantly change the roost conditions, causing bats to abandon and not return to the roost.

Implementing **Mitigation Measure M-BI-1a, Avoidance and Minimization Measures for Special Status Bats at Pier 31½**, would reduce potential impacts on special-status bats to a less-than-significant level by

requiring preconstruction surveys and implementing avoidance measures if potential roosting habitat or active roosts are located.

The American badger is known to inhabit coastal scrub habitat within the vicinity of Fort Baker. Operational and construction noise effects from Fort Baker limited ferry service would have minimal noise impacts on surrounding coastal scrub and grassland habitats, as these habitats are located away from the pile driving and ferry operation areas. Noise impacts are not a primary threat to the American badger.¹⁵¹ Due to the temporary nature of construction, infrequent nature of ferry operations at the site, and baseline noise levels, noise impacts to any American badgers potentially present in these habitats would be less than significant.

Birds

Special status bird species may be affected by increased noise levels, turbidity, or displacement during construction. Cliff swallows nest on the buildings at Fort Baker, and California least terns have been observed feeding in Horseshoe Bay and next to the jetties. California least terns are not known to nest at Fort Baker.^{152,153} The Pier 31½ site lacks suitable habitat for Endangered Species Act-listed bird species, although Migratory Bird Treaty Act-protected birds may be present, including gull species which are known to nest on pier sheds and or pier decks.

Construction would include pile driving, which could increase turbidity in the area immediately around the piers at Fort Baker and Pier 31½. Increased turbidity may reduce in-water visibility, which could affect bird foraging. Underwater noise during pile driving is also anticipated to discourage presence of fish or other bird prey species from the project area. Pile driving impacts to bird foraging resulting from increased turbidity and noise would be minimal, localized, and temporary. Additionally, the extent of available foraging habitat in close proximity to the project area is large. Therefore, impacts from pile driving are expected to be less than significant.

Renovations to structures or scrubbing of vegetation could destroy active bird nests, if present. Construction noise may also disturb nesting birds. These effects would constitute a potentially significant impact. The project proponent would be required to implement **Mitigation Measure M-BI-1b, Nesting Bird Protection Measures**, to reduce potential impacts on nesting special status bird species during construction:

¹⁵¹ Reid, F. and K. Helgen, *Taxidea taxus*, in IUCN 2013, *IUCN Red List of Threatened Species*, version 2013.1. Available from <http://www.iucnredlist.org/details/41663/0>.

¹⁵² California Department of Fish and Wildlife, California Natural Diversity Database and U.S. Fish and Wildlife Service database search of Project and surrounding quadrangles; San Francisco North, San Rafael, San Quentin, Richmond, Point Bonita, Oakland West, Hunters Point, and San Francisco South, 2017.

¹⁵³ California Department of Fish and Wildlife, *California Least Tern Breeding Survey 2011 Season*, 2012. Available from <https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=48694>.

Mitigation Measure M-BI-1b: Nesting Bird Protection Measures

Nesting birds and their nests shall be protected during construction by use of the following measures:

- Removal of trees, scrub vegetation and structures shall occur outside the bird nesting season (February 1 to August 30), to the extent feasible.
- If removal of trees, scrub vegetation or structures during bird nesting season cannot be fully avoided, a qualified wildlife biologist shall conduct preconstruction nesting bird surveys within 7 days prior to the start of such activities or after any construction breaks of 14 days or more. Surveys shall be performed for the project site and suitable habitat within 250 feet of the project site in order to locate any active passerine (perching bird) nests and within 500 feet of the project site to locate any active raptor (birds of prey) nests or double-crested cormorant or heron rookeries.
 - At Pier 31½, if it is determined that bird nesting habitat is only present for gulls, surveys may be conducted actively during construction from April through August during gull nesting season. Any old nests, potential nests, or nests under construction (but not active) shall be removed.
- If active nests are located during the preconstruction bird nesting survey, the wildlife biologist shall evaluate if the schedule of construction activities could affect the active nests and the following measures shall be implemented based on their determination:
 - If construction is not likely to affect the active nest, it may proceed without restriction; however, a biologist shall regularly monitor the nest to confirm there is no adverse effect and may revise their determination at any time during the nesting season. In this case, the following measure would apply.
 - If construction may affect the active nest, the biologist shall establish a no disturbance buffer. Typically, these buffer distances are between 25 feet and 250 feet for passerines and between 300 feet and 500 feet for raptors. These distances may be adjusted depending on the level of surrounding ambient activity (e.g., if the project area is adjacent to a road or active trail) and if an obstruction, such as a building, is within line-of-sight between the nest and construction. For bird species that are federally and/or state-listed sensitive species (i.e., fully protected, endangered, threatened, species of special concern), a proposed project representative, supported by the wildlife biologist, shall consult with the U.S. Fish and Wildlife Service and/or California Department of Fish and Wildlife regarding modifications to nest buffers, prohibiting construction within the buffer, modifying construction, and removing or relocating active nests that are found on the site.
- Removing inactive passerine nests may occur at any time. Inactive raptor nests shall not be removed unless approved by the U.S. Fish and Wildlife Service and/or California Department of Fish and Wildlife.

- Removing or relocating active nests shall be coordinated by the project representative with the U.S. Fish and Wildlife Service and/or California Department of Fish and Wildlife, as appropriate, given the nests that are found on site.
- Any birds that begin nesting within the project area and survey buffers amid construction activities are assumed to be habituated to construction-related or similar noise and disturbance levels and no work exclusion zones shall be established around active nests in these cases.

With incorporation of **Mitigation Measure M-BI-1b, Nesting Bird Protection Measures**, the proposed project would result in less-than-significant impacts on special status bird species.

Insects

The endangered mission blue butterfly is known to inhabit coastal chaparral and grasslands in close association with lupine in Marin County. These habitats, however, do not occur within the study area.¹⁵⁴ Therefore, construction and operations associated with Fort Baker limited ferry service would have no effect on the mission blue butterfly. There is no suitable habitat for special status insect species at Pier 31½, and there would be no impact to special status insects from proposed project construction or operation.

Plants

The entirety of improvements and operations associated proposed to occur at Pier 31½ would be constructed on existing developed and highly-utilized areas that do not provide habitat for special status plants. Areas surrounding Pier 31½ are similarly developed and devoid of special status plant species.

At Fort Baker, construction of the pedestrian pathway would displace existing vegetation along the proposed alignment. Existing ground cover in this area consists of disturbed or ornamental grass species and ruderal vegetation. Removal of this vegetation would result in no impacts to special status plant species. Ferry operations would not result in any greater impacts on vegetation. Therefore, the proposed project would result in no impacts on special status plants.

Summary

Based on the analysis presented above, the proposed project could result in significant impacts, either directly or through habitat modifications, on species identified as candidate, sensitive, or special-status in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service. The project proponent would be required to obtain and comply with all required resource agency permit conditions and to implement **Mitigation Measures M-BI-1a, Avoidance and Minimization Measures for Special Status Bats at Pier 31½**, and **M-BI-1b, Nesting Bird Protection Measures**, to reduce impacts to special status species to a less-than-significant level. The project

¹⁵⁴ Urban Wildlands Group, *Status and Variability of Mission Blue Butterfly Populations at Milagra Ridge, Marin Headlands, and Oakwood Valley*, 2012. Available from <http://www.urbanwildlands.org/Resources/MBBFinalLowRes.pdf>.

proponent would also implement **Improvement Measures I-BI-1a, Pile Driving Work Windows, I-BI-1b, Noise Monitoring Plan, and I-BI-1c, Marine Mammal Safety Zone**, to reduce potential less-than-significant impacts even further.

Impact BI-2: The proposed project would not have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the U.S. Fish and Wildlife Service and/or California Department of Fish and Wildlife. (Less than Significant)

Sensitive natural communities present within the project areas at the Pier 31½ and Fort Baker sites are limited to aquatic habitats. No riparian habitat, or other upland sensitive natural communities would be affected by the proposed project.

Although the proposed project would result in permanent shading (net increase of approximately 4,100 square feet at Pier 31½ and approximately 2,100 square feet at Fort Baker), the new piles and floats could increase invertebrate habitat and species diversity, thereby increasing foraging opportunities for fish. Long-term shading impacts on aquatic habitats would be insignificant, due to the size of the increased shading area relative to existing overwater structures, the abundance of suitable and similar neighboring habitat in the area, and ongoing disturbance of the area by commercial and recreational activities under existing conditions. Potential construction impacts to aquatic habitats, including turbidity and underwater noise effects, would be short term and less than significant, as described in Impact BI-1. Therefore, for effects to aquatic habitats classified as essential fish habitat under the Magnuson-Stevens Fishery Conservation and Management Act, including the Coastal Pelagic, Pacific Groundfish, and Pacific Coast Salmon Fishery Management Plans, all impacts from construction and operation of the proposed project would be less than significant.

Eelgrass (a special aquatic site, as described in Section B, Project Setting) or other submerged aquatic vegetation has not been observed at Pier 31½.^{155,156,157} Eelgrass has been observed in Horseshoe Bay, but outside the proposed project footprint (Figure 16). Proposed project activities would not affect these areas; therefore, the proposed project would not affect eelgrass.

¹⁵⁵ U.S. Army Corps of Engineers, *Agreement on Programmatic EFH Conservation Measures for Maintenance Dredging Conducted Under the LTMS Program*, June 9, 2011. Available from http://www.westcoast.fisheries.noaa.gov/publications/habitat/essential_fish_habitat/ltms_efh_full_signed_agreement_final_060911.pdf.

¹⁵⁶ San Francisco Bay Subtidal Habitat Goals Project, *San Francisco Bay Subtidal Habitat Goals Report*, 2010. Available from <http://www.sfbaysubtidal.org/report.html>.

¹⁵⁷ California Department of Fish and Wildlife, CDFW BIOS Viewer Eelgrass Dataset, last updated May 4, 2016, including San Francisco Bay data from Merkel & Associates (2014).

Impact BI-3: The proposed project would not have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means. (No Impact)

There are no wetlands located within or adjacent to the Pier 31½ or Fort Baker sites; therefore, the proposed project would have no impact.

Impact BI-4: The proposed project would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. (Less than Significant with Mitigation)

Both the Pier 31½ and Fort Baker sites contain aquatic habitat that may support migratory fish or marine mammal species, as well as nesting migratory birds protected by the Migratory Bird Treaty Act. As discussed in Impact BI-1, buildings at Pier 31½ may also support nesting bats. The proposed improvements would not create any barriers to movement or migration, and would not permanently affect native wildlife nursery sites. With implementation of **Improvement Measures I-BI-1a, Pile Driving Work Windows, I-BI-1b, Noise Monitoring Plan, and I-BI-1c, Marine Mammal Safety Zone**, any potential impacts to fish or marine mammal movement from temporary construction noise would be reduced to a less-than-significant level. No other construction impacts to movement or migration are anticipated. With implementation of **Mitigation Measures M-BI-1a, Avoidance and Minimization Measures for Special Status Bats at Pier 31½, and M-BI-1b, Nesting Bird Protection Measures**, proposed project impacts to bat and bird nesting from construction would be reduced to a less-than-significant level.

Impact BI-5: The proposed project would not conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance. (Less than Significant)

The proposed project would not require tree removal and would therefore not conflict with City and County of San Francisco Tree Protection Legislation (including San Francisco Public Works Code Section 8.02-8.11, which requires disclosure and protection of protected trees), the Marin County Native Tree Protection and Preservation Ordinance, or the City of Sausalito Tree and View Preservation Ordinance. There are no other local policies or ordinances for protecting biological resources that are applicable to the project sites at Pier 31½ and Fort Baker. Therefore, the proposed project would result in less-than-significant impacts related to potential conflicts with local policies or ordinances protecting biological resources.

Impact BI-6: The proposed project would not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan. (No Impact)

There are no adopted Habitat Conservation or Natural Community Conservation plans for the City and County of San Francisco, or for Marin County and Sausalito. The California Eelgrass Mitigation Policy applies to any activities in California which may adversely affect eelgrass. As noted in Impact BI-2, the proposed project would not affect eelgrass, and therefore would not conflict with the California Eelgrass Mitigation Policy. The proposed project would have no impact associated with conflicting with any habitat conservation plans.

Impact C-BI: The proposed project in combination with other past, present or reasonably foreseeable projects, could result in significant impacts to biological resources. (Less than Significant with Mitigation)

The geographic context for the analysis of cumulative impacts on biological resources generally encompasses the waters surrounding the project sites and considers the projects listed in Table 6. There are no known projects under development within 0.25 mile of Fort Baker. There are three potential cumulative projects in the vicinity of the Pier 31½ site listed in Table 6 that could affect biological resources: ongoing Port pier maintenance dredging; ongoing routine repair and maintenance of Port facilities; and the Pier 43½ project (Red and White Ferry Embarkation Improvements). As is the case for the proposed project, construction and operation of these projects would be required to comply with applicable state and federal regulations protecting special status species, which would reduce the potential for cumulative impacts on biological resources.

Without project-specific mitigation, the contribution of the proposed project to significant cumulative biological resources impacts could be considerable, due to the proposed project's potential to cause significant, project-specific impacts on sensitive biological resources. However, implementing **Mitigation Measures M-BI-1a, Avoidance and Minimization Measures for Special Status Bats at Pier 31½**, and **M-BI-1b, Nesting Bird Protection Measures**, would avoid or substantially minimize the proposed project's effects on special status species. **Improvement Measures I-BI-1a, Pile Driving Work Windows, I-BI-1b, Noise Monitoring Plan**, and **I-BI-1c, Marine Mammal Safety Zone**, would also further reduce potential impacts. As a result, these measures would reduce the proposed project's contribution to cumulative impacts on biological resources to a less-than-cumulatively-considerable level with mitigation (less than significant with mitigation).

<i>Topics:</i>	<i>Potentially Significant Impact</i>	<i>Less Than Significant with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>	<i>Not Applicable</i>
14. GEOLOGY AND SOILS— Would the project:					
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:					
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? (Refer to Division of Mines and Geology Special Publication 42.)	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
ii) Strong seismic ground shaking?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
iii) Seismic-related ground failure, including liquefaction?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
iv) Landslides?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Result in substantial soil erosion or the loss of topsoil?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Be located on geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code, creating substantial risks to life or property?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

The project sites would not be located on expansive soil; therefore, Initial Study Checklist criterion E.14(d) is not applicable to the proposed project. The proposed project would connect to existing sewer and stormwater collection and treatment systems and would not use a septic water disposal system; therefore, Initial Study Checklist criterion E.14(e) is not applicable to the proposed project.

Impact GE-1: The proposed project would not result in exposure of people and structures to potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, seismic ground-shaking, liquefaction, lateral spreading, or landslides. (Less than Significant)

Pier 31½

The proposed project site at Pier 31½ and the greater San Francisco waterfront area would experience violent or very strong ground shaking (Modified Mercalli Intensity Unit VIII to IX) in the event of a large earthquake along the San Andreas or Hayward faults (modeled as magnitude 7.5 and 6.9, respectively).¹⁵⁸ Additionally, the area has been mapped as a high liquefaction hazard area, with liquefaction likely to be triggered by strong ground shaking. Seismically induced ground shaking or liquefaction may result in structural damage and possible injury or loss of life. Given the age of the existing piers and structures at Pier 31½, it is anticipated that a large earthquake could potentially result in damage to existing structures and potential harm to users.

Fill materials and bay muds underlie Pier 31½ and may be susceptible to seismically-induced settlement. In the absence of site-specific subsurface information, the precise potential for ground subsidence is not known. Most fills along this section of the San Francisco waterfront are old and were not constructed using currently-required engineering methods. However, because of the site's relative age, most fill compression has likely occurred as a result of natural compression. In the event of a large seismic event, there may be some localized settlement associated with liquefaction. Fill materials are not expected to have expansive properties, and damage due to soil expansion is unlikely. The San Francisco waterfront is relatively flat in the vicinity of Pier 31½. Therefore, landslides in this area are not likely, and the site has not been delineated as within an earthquake-induced landslide zone. Impacts associated with landslides or slope failure are unlikely.

The proposed project would include a retrofit of existing structures at the Pier 31½ site to address seismic hazards and minimize their potential impacts. The design and construction of these improvements would adhere with applicable laws and policies related to seismic safety requirements. Therefore, with implemented retrofits and improvements to the structure, the proposed project would reduce potential for substantial adverse effects resulting from seismic hazards at Pier 31½ as compared to existing conditions, and impacts would be considered less than significant.

Fort Baker

Fort Baker would experience moderate to very strong ground shaking (Modified Mercalli Intensity Unit VI-VIII) in the event of a large seismic event along the San Andreas or Hayward faults (modeled as magnitude 7.5 and 6.9, respectively).¹⁵⁹ Earthquake-induced ground shaking could potentially damage

¹⁵⁸ Association of Bay Area Governments, Interactive Future Earthquake Shaking Scenarios Map, <http://gis.abag.ca.gov/website/Hazards/?hlyr=northSanAndreas>, accessed March 18, 2013.

¹⁵⁹ Ibid.

structures and result in injury. The Fort Baker pier area has a very low susceptibility to liquefaction.¹⁶⁰ Therefore, impacts due to liquefaction from improving the Fort Baker pier are unlikely. Underlying materials at Fort Baker include natural deposits of gravelly loam and fill materials, which may be susceptible to seismic-induced settlement.¹⁶¹ However, because of their age, most fill compression at Fort Baker has likely occurred already, as evidenced by a relative lack of apparent surface distress in areas of the site likely underlain by fill.

The proposed project would include a retrofit of the existing Fort Baker pier to address seismic hazards and minimize potential impacts. The design and construction of these improvements would adhere with applicable laws and policies related to seismic safety requirements. Therefore, with implemented retrofits and improvements to the structure, the proposed project would reduce potential for loss, injury, or death resulting from seismic hazards at Fort Baker as compared to existing conditions, and impacts would be considered less than significant.

Impact GE-2: The proposed project would not result in substantial loss of topsoil or erosion. (Less than Significant)

Construction of the proposed project at the Pier 31½ site would not expose topsoil, as all construction would occur on the pier or in the water. Construction of the proposed project at Fort Baker would include construction of a trail. Because the proposed project site (including the proposed trail area) is flat and trail construction would involve minor grading of surficial soils, construction activities would not result in substantial soil erosion. In addition, the construction contractor would be required to implement best management practices to prevent erosion and discharge of soils into stormwater runoff (see Section E.15, Hydrology and Water Quality). This impact would be less than significant.

Impact GE-3: The proposed project would not be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. (Less than Significant)

Fill materials and bay muds underlie the proposed project sites and may be susceptible to seismically induced settlement, most likely associated with seismically induced liquefaction. In the event of an earthquake, there may be some localized settlement associated with liquefaction. However, construction and operation of the proposed project would not result in additional risk over existing conditions based on adherence to building codes and improvements, and proposed project design details discussed in Impact GE-1. Therefore, impacts would be less than significant.

¹⁶⁰ Association of Bay Area Governments, Liquefaction Susceptibility Maps, <http://gis.abag.ca.gov/website/Hazards/?hlyr=liqSusceptibility>, last modified January 3, 2013, accessed March 18, 2013.

¹⁶¹ National Resources Conservation Service, Web Soil Survey Search of Project Area, <https://websoilsurvey.nrcs.usda.gov/app/WebSoilSurvey.aspx>, last modified February 17, 2012, accessed March 18, 2013.

Impact GE-4: The proposed project would not indirectly destroy a unique paleontological resource or site or unique geologic feature. (Less than Significant)

As discussed above, fill materials and bay muds underlie the proposed project sites. There are no unique geological features on or near the sites.¹⁶² Native sediments may be found under the fill but construction would not expose such sediment. Due to its geomorphological history, the proposed project sites are not likely to contain any fossils other than invertebrate fossils that are in a re-deposited context. Therefore, it is very unlikely that any fossil that is unique or scientifically significant is present, and impacts would be less than significant.

Impact C-GE: The proposed project would not make a considerable contribution to any cumulative significant effects related to geology or soils. (Less than Significant)

The geographic scope of potential geology and soils impacts are generally restricted to the project sites and immediate vicinity because related impacts are relatively localized or even site-specific. As discussed above, the proposed project would result in less-than-significant impacts related to geology and soils. Nearby cumulative development projects would be subject to the same seismic safety standards and design review procedures applicable to the proposed project. Compliance with the seismic safety standards and the design review procedures would ensure that the effects from nearby development projects would also be less than significant. The effects of each project would be restricted to its immediate vicinity. Impacts on paleontological resources are also site-specific and generally do not combine with impacts of other projects. As discussed above, the proposed project would not affect any unique paleontological resources, and thus would not combine with impacts of any other projects on such resources. For these reasons, the proposed project would not combine with past, present, and reasonably foreseeable future projects in the project vicinity to create a significant cumulative impact related to geology and soils or to unique paleontological resources.

¹⁶² Schlocker, Julius, Geology of the San Francisco North Quadrangle, California, Geological Survey Professional Paper 782, 109 pp., 1974. Available from <https://pubs.usgs.gov/pp/0782/report.pdf>.

<i>Topics:</i>	<i>Potentially Significant Impact</i>	<i>Less Than Significant with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>	<i>Not Applicable</i>
15. HYDROLOGY AND WATER QUALITY— Would the project:					
a) Violate any water quality standards or waste discharge requirements?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on- or off-site?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) Otherwise substantially degrade water quality?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other authoritative flood hazard delineation map?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h) Place within a 100-year flood hazard area structures that would impede or redirect flood flows?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
j) Expose people or structures to a significant risk of loss, injury or death involving inundation by seiche, tsunami, or mudflow?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

The proposed project would not construct housing; therefore, Topic E.15(g) is not applicable to the proposed project.

Impact HY-1: The proposed project would not violate any water quality standards or waste discharge requirements and would not otherwise substantially degrade water quality. (Less than Significant)

All waters of the United States, including San Francisco Bay, are subject to regulation by the San Francisco Bay Regional Water Quality Control Board (RWQCB) pursuant to Section 401 of the Clean Water Act. Waters of the United States generally correspond to those waters delineated as federally jurisdictional pursuant to Section 404 of the Clean Water Act. In California, the Porter-Cologne Act is the principal law governing water quality regulation. It establishes a comprehensive program to protect water quality and the beneficial uses of water. The Porter-Cologne Act applies to surface waters, wetlands, and ground water and to both point and nonpoint sources of pollution. Regulatory standards and objectives for water quality in the Bay are established in the Water Quality Control Plan for the San Francisco Bay Basin, commonly referred to as the Basin Plan.¹⁶³ The Basin Plan identifies existing and potential beneficial uses for surface and ground waters and provides numerical and narrative water quality objectives designed to protect those uses.

The open tidal waters of the San Francisco Bay below the highest astronomical tide are subject to regulation under Section 404 of the Clean Water Act. Those waters below the Mean High Water elevation are also regulated under Section 10 of the Rivers and Harbor Act. Under Section 401 of the Clean Water Act, every applicant for a federal permit or license for any activity that may result in a discharge to a water of the United States must obtain a State Water Quality Certification from the RWQCB that the proposed activity will comply with state water quality standards.

Construction

Proposed project construction would involve driving hollow steel piles for installation of the gangways and floats for the new berths at each project site. A total of 12 piles would be installed at Pier 31½ and eight piles at Fort Baker. Pile driving may disturb sediments and result in temporary localized increases in turbidity, releases of chemicals in the sediment, increases in dissolved oxygen, and changes to pH in the water column. However, the San Francisco Bay is a naturally turbid estuary.¹⁶⁴ Potential impacts on water quality would be short-term, as pile driving operations are only expected to last a matter of days, and conditions would quickly return to baseline levels after pile driving activities are completed. In addition, construction of the proposed project would comply with all local, state, and federal permits, including San Francisco Bay Conservation and Development Commission, U.S. Army Corps of Engineers, and San Francisco Regional Water Quality Control Board requirements. Applicable permit and plan conditions are expected to lay out requirements for maintaining water quality during construction, including but not limited to minimizing turbidity, managing trash, and handling fuels and chemicals. Through issuance of the building permit, the proposed project construction at Pier 31½ would also be

¹⁶³ San Francisco Bay Regional Water Quality Control Board (RWQCB), *Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan)*, May 4, 2017. Available online at https://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/planningtmdls/basinplan/web/docs/BP_all_chapters.pdf.

¹⁶⁴ CALFED Bay-Delta Program, *Water Quality Program Plan Final Programmatic EIS/EIR*, July 2000.

required to comply with the Port of San Francisco's standard best management practice for debris and stormwater management during construction, which require the following:

Debris Management

- Closed debris containment booms, floating debris screens, and/or absorbent booms will be positioned beneath and alongside work areas whenever possible. During construction, the barges performing the work will be moored in a position to capture and contain the debris generated during any sub-structure or in-water work. Care will be taken to minimize debris falling into the water. In the event that debris does reach the bay, personnel in workboats will immediately retrieve the debris for proper handling and disposal. For small-scale over-water repairs and maintenance, tarps, tubs and/or vacuums will be used as appropriate to catch sawdust, debris, and drips.
- All construction material, wastes, debris, sediment, rubbish, trash, fencing, etc., will be removed from the site on a regular basis during work and at project completion. Debris will be transported to an authorized disposal area.

Stormwater Management

- Minimal ground disturbance is anticipated since the proposed activities focus on maintenance and repair of existing hard-surfaced structures. Where ground disturbance is necessary, construction crews will reduce the footprint of disturbance to the minimum necessary to complete the project.
- Construction material that could wash or blow away will be covered every night and during any rainfall event.
- Construction materials will be stored in an area that does not freely drain to the bay, free from standing water and wet soil, and protected from rain. If necessary, materials will be stored on skids or support timbers to keep them off the ground.
- Adequate erosion control supplies (sand bags, wattles, shovels, etc.) shall be kept on site and during all construction activities to ensure materials are kept out of water bodies.

No grading would occur as part of the proposed project at the Pier 31½ site. Landside improvements at the Fort Baker site could require minimal grading over a maximum area of 0.35 acre to create a trail. Fuels and other chemicals used during construction at both sites, as well as hazardous building materials (i.e., lead-based paint, asbestos, and polychlorinated biphenyl-containing materials) encountered during demolition at the Pier 31½ site, could potentially degrade Bay water quality if improperly handled or spilled. Specific to Clean Water Act Section 303(d) listed pollutants for the Central San Francisco Bay,¹⁶⁵ while heavy metals and polychlorinated biphenyl-containing materials may be found in fill soils or building materials on site, the proposed project would not involve extensive grading at the Fort Baker site

¹⁶⁵ State Water Resources Control Board and Regional Water Quality Control Board, *2010 Integrated Report on Water Quality with Web-Based Interactive Map*, April 2010. Available from http://www.waterboards.ca.gov/water_issues/programs/tmdl/integrated2010.shtml.

and would not involve any grading at the Pier 31½ site, which would reduce potential for release of hazardous materials in on-site soils. Building materials would be handled and disposed of in accordance with applicable hazardous materials regulations and permit conditions. Construction at Pier 31½ and Fort Baker would occur in adherence with site-specific Spill Prevention, Control, and Countermeasure Plans required as part of the concessioner agreement for both sites. As outlined above, the proposed project would comply with standard Port construction best management practices for water quality and similar construction contract requirements at Fort Baker. Construction activities within and over the Bay would be subject to the requirements of permits issued by the US Army Corps of Engineers under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act that would receive water quality certification from the RWQCB under Section 401 of the Clean Water Act. The permits would specify the best management practices, such as those described above, for the protection of water quality. Implementation of water quality control measures proposed as part of the project and enforced through compliance with permit requirements would ensure that water quality impacts related to construction activities within and over the Bay would be less than significant. As such, there would be minimal potential for impacts on water quality from construction of the proposed project related to Section 303(d)-listed pollutants.

Given the relatively high natural turbidity of the San Francisco Bay, the localized nature of impacts, the lack of any excavation or significant earthwork, and compliance with all permits and regulations, construction would not substantially degrade water quality and impacts would be less than significant.

Operations

Ferry operations have the potential to impact water quality from potential pollutant discharges of hazardous materials, including chemicals and solvents used onboard, boat cleaning and maintenance materials, fuels, bilge or ballast water, sewage from toilets, and gray water, and trash from passengers and visitors. Under the proposed project, the number of peak day ferry trips from the Pier 31½ site would increase from 27 to 29, and limited ferry service would be introduced at Fort Baker. Ferry operations at both the Pier 31½ and Fort Baker sites would adhere with plans and policies designed to address potential water quality impacts. Consistent with past practices at the Pier 31½ site, proposed project operations would obtain coverage under the National Pollutant Discharge Elimination System General Permit for Storm Water Discharges Associated with Industrial Activities. In accordance with the requirements of the project's National Pollutant Discharge Elimination System permit, the project proponent would be required to prepare and implement a Stormwater Pollution Prevention Plan for operations at the Pier 31½ site and the Park Service would prepare a Stormwater Pollution Prevention Plan for operations at the Fort Baker site. The Stormwater Pollution Prevention Plan would identify pollutant sources within the site and provide site-specific best management practices regarding control of sediments in runoff and storage and use of hazardous materials to prevent discharge of pollutants into stormwater. For the Pier 31½ site, the Stormwater Pollution Prevention Plan would additionally conform with the San Francisco Public Works Code Section 147.2 to minimize stormwater runoff impacts. For the Pier 31½ and Fort Baker sites, respectively, the project proponent and the Park Service would also adhere

to site-specific Spill Prevention Control and Countermeasure Plans or equivalent plans that would address protecting water quality through implementation of best management practices, hazardous materials storage and handling protocols, and spill prevention and cleanup procedures.

Vessel fueling at Pier 31½ under the proposed project would continue consistent with past practices, where fuel is brought to the site via truck to directly fuel the ferries. This activity would continue in adherence with applicable regulations, including Coast Guard regulations (33 CFR 156.120 and 33 CFR 155.320). Any spills would be cleaned up immediately using spill response equipment as identified in the Spill Prevention Control and Countermeasure Plan. The Coast Guard maintains a Marine Environmental Protection Division whose primary mission includes containment and cleanup of oil discharges and hazardous substances introduced into navigable waters in coordination with other local, state, and federal agencies.

Ferries do not typically take on or discharge large quantities of ballast water. Nonetheless, any such actions would occur in compliance with federal and state regulations, including the Vessel General Permit and Ballast Water Management for Control of Nonindigenous Species Act. These actions would minimize the potential for introducing invasive aquatic species, which are a Section 303(d)-listed pollutant, and protect Bay waters from other pollutants present in ballast water. Furthermore, ferries servicing the proposed project sites would only operate in the bay; as such, water quality impacts associated with increased invasive marine species would not be expected.

Sanitary sewage from ferries would be subject to the requirements of the MARPOL convention and Section 312 of the Clean Water Act, which include requirements for onboard marine sanitation devices, as well as for storage and discharge of sewage, treatment of sewage, and disinfection of sewage. Sewage systems onboard the ferries would be self-contained and would pump off into the San Francisco Public Utilities Commission combined sewer system in San Francisco.

Due to the proximity of Pier 31½ and Fort Baker to the bay, litter from visitors at the sites could potentially enter the bay. The ferry operator would be responsible for implementation of a trash collection and management program, and waste management at both proposed project sites would proceed in adherence with all applicable federal, state, and local regulations for waste management and disposal. At Pier 31½, design of new facilities must comply with the City's Zero Waste requirements, including providing space and access to ensure convenient recycling and composting. Solid waste collection and disposal services would continue to be provided by existing service providers.

The proposed project would be required to comply with San Francisco's Stormwater Management Requirements and Design Guidelines,¹⁶⁶ which regulate the volume and quality of stormwater discharged from the site into the public combined stormwater and sewer collection system. Compliance with the

¹⁶⁶ San Francisco Public Utilities Commission, *Stormwater Management Requirements and Design Guidelines*, May 2016. Available from <http://www.sfwater.org/Modules/ShowDocument.aspx?documentID=9026>.

2016 Stormwater Management Requirements and Design Guidelines would ensure that discharges comply with current standards. Wastewater at the site would continue to be discharged into the combined system, as discussed in Section E.11, Utilities and Service Systems.

While the proposed project would result in a minor increase in the number of ferry trips from the Pier 31½ site compared to existing conditions and would introduce limited ferry service to Fort Baker, development of required plans and compliance with regulations as detailed above would ensure that water quality impacts associated with long-term operations of the proposed project would be less than significant.

Impact HY-2: The proposed project would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or lowering of the local groundwater table. (No Impact)

The proposed project neither involves excavation to depths that would affect aquifer systems or groundwater movement nor includes the construction of substantial new impervious surfaces that would impede groundwater recharge. Therefore, no impacts related to groundwater would occur from the proposed project.

Impact HY-3: The proposed project would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on- or off-site. (Less than Significant)

The proposed project would modify and upgrade the existing on-site stormwater drainage system at Pier 31½ to accommodate the proposed improvements and provide lateral connections to the existing municipal sewer system. Although the proposed project includes resurfacing at Pier 31½, the entirety of the existing site is already developed with impervious surfaces; therefore, the proposed project would not alter the existing drainage pattern or result in any soil erosion. The proposed project would comply with the San Francisco Storm Water Management Requirements and Design Guidelines,¹⁶⁷ including measures pertaining to utility connections, drainage patterns, and impermeable surfaces. Therefore, there would be less-than-significant impacts from drainage pattern changes at the Pier 31½ site.

At Fort Baker, stormwater is currently conveyed via a trunkline system consisting of catch basins, pipes, and concrete-lined swales. Stormwater is gathered and conveyed via gravity flow to four major storm drain outfalls along the seawall at Horseshoe Bay.¹⁶⁸ No significant upland infrastructure would be installed to support limited ferry service to Fort Baker; a new pedestrian pathway would be constructed to connect Cavallo Point Lodge and the Bay Area Discovery Museum with the repaired pier. The pedestrian pathway would cover an area of approximately 0.35 acre, and would be constructed with

¹⁶⁷ Ibid.

¹⁶⁸ National Park Service, *Fort Baker Plan Final Environmental Impact Statement*, October 1999. Available from <http://parkplanning.nps.gov/document.cfm?parkID=303&projectID=20244&documentID=20847>.

permeable surfaces (e.g., gravel). These improvements are not anticipated to alter the existing drainage pattern or otherwise result in changes that would contribute substantial erosion.

Based on the analyses presented above, the proposed project would result in less-than-significant impacts related to erosion or siltation from drainage pattern alterations.

Impact HY-4: The proposed project would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site. (Less than Significant)

As described under Impact HY-3, the proposed project would result in no substantial alterations to drainage patterns. The Pier 31½ site is entirely paved and the proposed improvements would not increase the amount of impermeable surfaces. New construction would be designed and constructed with drainage infrastructure that complies with the San Francisco Storm Water Management Requirements and Design Guidelines and other applicable regulations. Proposed improvements at Fort Baker include constructing a permeable trail (as described in Impact HY-3), which is not anticipated to affect stormwater runoff. Although Pier 31½ is within a Federal Emergency Management Agency-delineated 100-year flood plain,¹⁶⁹ and the Fort Baker site may be subject to inundation during large storm events, the proposed project would not alter existing drainage patterns in any way that exacerbates existing flood hazards. Therefore, there would be less-than-significant impacts related to flooding from altering existing drainage patterns.

Impact HY-5: The proposed project would not create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff. (Less than Significant)

As described under Impact HY-3, proposed improvements at Pier 31½ would not increase impermeable surface areas and therefore would not increase stormwater runoff from the site. New construction would be designed and constructed in compliance with the San Francisco Stormwater Management Requirements and Design Guidelines, including requirements to reduce runoff. Proposed improvements at Fort Baker include construction of permeable surfaced trail, which is not anticipated to affect stormwater runoff volume or quality.

Both proposed project sites are adequately served by existing stormwater drainage facilities. Compliance with applicable regulations, as detailed under Impact HY-1, would ensure that proposed project operations neither introduce nor contribute substantial inputs of polluted runoff.

¹⁶⁹ Federal Emergency Management Agency, Flood Insurance Rate Map, City and County of San Francisco, California, panel number 120 of 260, 2013. Available from http://sfgov.org/sfc/riskmanagement/Modules/ShowImage_5bf6.jpg?imageid=2672.

For these reasons, the proposed project would result in less-than-significant impacts related to exceeding the capacity of stormwater drainage systems or providing substantial additional sources of polluted runoff.

Impact HY-6: The proposed project would not place within a 100-year flood hazard area structures that would impede or redirect flood flows. (No Impact)

Pier 31½ is within a Federal Emergency Management Agency-delineated 100-year flood plain, and waterfront flooding could occur in this area.¹⁷⁰ Replacement piles or small structures constructed on the pier would not impede or redirect flood flows. Federal Emergency Management Agency flood maps do not include information for the Fort Baker pier area; however, waterfront areas in adjacent Sausalito and the Marin Headlands are mapped by the Federal Emergency Management Agency as occurring with the 100-year flood zone.¹⁷¹ As such, the Fort Baker pier area would likely be subject to similar inundation. Construction of the proposed trail and pier improvements (e.g., new piles and floats) would not impede or redirect flood flows.

Based on the analyses presented above, there would be no impact related to redirecting or impeding flood flows resulting from the proposed project.

Impact HY-7: The proposed project would not expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam. (Less than Significant)

Pier 31½ and Fort Baker are not located in areas where there are levees or dams, or in any dam inundation zones. Therefore, exposure to risk of flooding from the failure of a levee or dam is not applicable to the proposed project.

As described above, Pier 31½ is within a Federal Emergency Management Agency-delineated 100-year flood plain, and the Fort Baker pier area may be subject to inundation during large storm events. Under the U.S. Geological Survey-predicted sea level rise scenario of 100 centimeters (29 inches), the proposed outdoor program area at Pier 31½ and the beach areas northeast and southwest of the Fort Baker pier would be vulnerable to inundation during a 100-year flood event. The areas vulnerable to inundation would further increase under the U.S. Geological Survey sea level rise scenario of 150 centimeters (59 inches).¹⁷²

¹⁷⁰ Ibid.

¹⁷¹ Federal Emergency Management Agency, Flood Insurance Rate Map, Marin County Unincorporated and Incorporated Areas, California, panel number 528 of 531, 2014. Available from <http://www.ci.sausalito.ca.us/modules/showdocument.aspx?documentid=15111>.

¹⁷² U.S. Geological Survey, *Potential Inundation due to Rising Sea Levels in the San Francisco Bay Region*, updated December 14, 2014, accessed September 6, 2017. Available from <https://cascade.wr.usgs.gov/data/Task2b-SFBay/index.shtm>.

Although the proposed project would result in increased visitation to both the Pier 31½ and Fort Baker, weather advisories and flood warning systems would provide adequate time for site visitors to evacuate. At Pier 31½, the proposed project would not alter the flooding risk for the existing bulkhead buildings and piers, and would only construct floating docks and several small structures on the marginal wharf. At Fort Baker, no new upland structures are proposed. The proposed improvements and operations at both sites would not increase the exposure of individuals or structures to substantial risks of loss, injury, or death involving flooding. Therefore, impacts related to flood risk as a result of the proposed project would be less than significant.

Impact HY-8: The proposed project would not expose people or structures to a significant risk of loss, injury or death involving inundation by seiche, tsunami, or mudflow. (Less than Significant)

The Pier 31½ and Fort Baker sites are not located near geologic conditions that would generate mudflow (e.g., not in mountainous areas or near channelized features).

A seiche is caused by oscillation of the surface of an enclosed body of water during an earthquake such as San Francisco Bay due to an earthquake or large wind event. Seiches can result in long-period waves that cause run-up or overtopping of adjacent land masses, similar to a tsunami.

Pier 31½ and Fort Baker are within the tsunami inundation area, as delineated on the state's tsunami inundation maps.^{173,174} The primary tsunami threat in San Francisco Bay is from distant earthquakes along subduction zones elsewhere in the Pacific basin. By the time a tsunami enters the bay, its impacts would be reduced compared to those on the open coast, likely involving just a few feet of inundation. In an extreme worst-case scenario involving a rupture of the Alaska-Aleutians subduction zone, waves at Pier 31½ could reach as high as 10.17 feet.¹⁷⁵ Tsunami-induced wave height increases have not been estimated for Marin County coastal areas within the bay, such as Fort Baker.¹⁷⁶

The National Oceanic and Atmospheric Administration operates the tsunami warning system that serves both San Francisco and Marin counties, among other areas.¹⁷⁷ Tsunami warning procedures for the counties of San Francisco and Marin are provided in their respective tsunami emergency response

plans.^{178,179} As discussed above under Impact HY-7, the proposed project would not alter the flooding risk for the existing bulkhead buildings and piers, and would only construct floating docks and several small structures on the marginal wharf. At Fort Baker, no new upland structures are proposed. Although the proposed project would result in minor increases in the number of visitors at the Pier 31½ and Fort Baker project sites, based on the low likelihood of a significant seiche or tsunami event at Pier 31½ and Fort Baker, and taking into consideration the National Oceanic and Atmospheric Administration's tsunami warning system and the City/County's emergency response plans, the proposed project would not expose individuals or structures to a substantial risk of loss, injury or death due to inundation from seiche or tsunami, and this impact would be less than significant.

Impact C-HY: The proposed project, in combination with other past, present, or reasonably foreseeable projects, would result in less-than-significant cumulative impacts to hydrology and water quality. (Less than Significant)

The geographic scope of potential cumulative impacts on water quality encompasses Lower San Francisco Bay; the geographic scope of effects on drainage and flooding consists of areas in the vicinity of project sites; and the geographic scope of flooding consists of the low-lying areas along the bay waterfront.

As outlined in Impact HY-1, the proposed project would not result in significant impacts on water quality. As is the case for the proposed project, construction and operation of other projects that could contribute to a cumulative impact would be required to comply with applicable local, state, and federal water quality regulations. Implementation of these requirements under each individual project would ensure that all discharges comply with regulatory standards and would not otherwise degrade water quality. Therefore, the proposed project, in combination with other reasonably foreseeable projects, would result in less-than-significant cumulative water quality impacts.

As discussed in Impacts HY-3 and HY-4, the proposed project would have less-than-significant impacts with respect to erosion or flooding resulting from alterations to drainage patterns at the project sites. However, the proposed project's drainage changes would be negligible and would not contribute considerably to any potential cumulative impact.

With respect to storm drain system capacity and polluted runoff as discussed in Impact HY-5, the proposed project would be subject to compliance with established guidelines for the combined sewer system and site runoff which would ensure impacts are less than significant. Other cumulative projects would be subject to the same regulations and, accordingly, no significant cumulative impact would result.

¹⁷⁸ Ibid.

¹⁷⁹ Marin County Sheriff Office of Emergency Services, *Tsunami Annex Marin Operational Area Emergency Operations Plan*, January 2007.

Finally, low lying shoreline areas are currently subject to flooding and will be subject to an increased risk of flooding in the future due to sea level rise. Because the hazard warning systems would protect people at the proposed project and other cumulative project sites, cumulative impacts regarding risk of injury and death would be less than significant. Given the small size of new structures and the floating nature of new elements that would be constructed under the proposed project, the proposed project would not contribute considerably to any potential cumulative impact related to existing and future flooding hazards.

h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

The Pier 31½ site is not listed in the GeoTracker or EnviroStor database of hazardous material sites. The Embarcadero was once a highly-industrialized area supporting railyards, fuel terminals, shipyards, and tanneries. In addition, much of the San Francisco shoreline is made up of imported fill, consisting of soil and debris from the 1906 earthquake, which potentially contains lead and other hazardous materials. Because of potential public and worker health exposure, the San Francisco Board of Supervisors adopted the Maher ordinance (Article 22A of the San Francisco health code) in 1986, which requires soil analysis for a specified list of inorganic and organic chemicals at construction sites where: 1) at least 50 cubic yards of soil are disturbed; 2) there is construction on the bay side of the historic high-tide line; or 3) there is reason to believe that hazardous waste may be present. The Embarcadero area is subject to the Maher ordinance, which denotes areas of known historical landfill with a high likelihood of contamination.¹⁸⁰

Fort Baker has a similar history of former use by the U.S. Department of Defense. It is listed in the Formerly Used Defense Site database as both a hazardous, toxic, and radioactive waste site; and a military munitions response program site.¹⁸¹ The U.S. Army is the lead agency conducting the investigation and cleanup of areas at Fort Baker contaminated by hazardous materials as a result of military operations. During the site investigation of Fort Baker, eight areas were identified with elevated soil concentrations of polycyclic aromatic hydrocarbons, pesticides, metals, and petroleum hydrocarbons. Of the eight areas, four have been recommended for advancement to a remedial and feasibility investigation. These areas include the storm drain system, Horseshoe Bay, a petroleum tank site near Building 637, and a concrete basin near Building 407. The four remaining areas (an engine repair shop, a small paint shed, soil beneath the deck of the historic boat shop, and the vehicle wash rack adjacent to Building 691) have been cleaned up. Underground storage tanks, which may have started leaking into the surrounding soils, likely remain throughout Fort Baker.¹⁸² The project site is not among the eight Fort Baker sites with identified elevated soil concentrations of polycyclic aromatic hydrocarbons, pesticides, metals, and petroleum hydrocarbons.

Because the proposed project sites are not within a quarter-mile of any schools and are not near any private airstrips, Topics E.16(c), E.16(e), and E.16(f) are not applicable to the proposed project.

Impact HZ-1: The proposed project would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials, or through reasonably foreseeable upset or accident conditions involving the release of hazardous materials into the environment. (Less than Significant)

¹⁸² National Park Service, *Marin Headlands and Fort Baker Transportation Infrastructure and Management Plan Final Environmental Impact Statement*, March 2009. Available from https://www.nps.gov/goga/learn/management/upload/feis_2009-0310_150dpi.pdf.

Construction

Construction activities at Pier 31½ include improvements to the bulkhead buildings and sheds which, due to their age, may contain hazardous materials, including asbestos, lead-based paint, and polychlorinated biphenyls. Wood underneath the pier may be treated with hazardous compounds. Chemicals and fuels may be used during construction. While artificial fill or marine sediments at Pier 31½ may contain polycyclic aromatic hydrocarbons, heavy metals, oil and grease, or volatile organic compounds, the proposed project would not involve grading or soil disturbance and is not expected to disturb potentially hazardous soils either during pile driving or other activities.

As a building permit requirement, the proposed project would be required comply with the Port of San Francisco's standard best management practice for spill prevention and response, which requires the following:

- Fueling and maintenance of vehicles and equipment will be conducted offsite with the exception of barge-mounted and fixed cranes. Fueling locations will be inspected after fueling to document that no spills have occurred. Any spills will be cleaned up immediately and reported in accordance with existing Port standard operating procedures for spill reporting. All Port vehicles carry spill response supplies.
- Fueling cranes on barges or fixed to pier decks over water will be performed using proper fuel transfer procedures as specified by federal regulations for fuel transfer. Land-based equipment will be fueled by mobile trucks with secondary containment or at the Port's maintenance facility. Fueling location will be inspected after fueling to document that no spills have occurred. Spills will be cleaned up immediately using spill response equipment.
- Well-maintained equipment will be used to perform construction work, and, except in the case of a failure or breakdown, equipment maintenance will be performed off site. Repair crews will check heavy equipment daily for leaks, and not use equipment until any leak is fixed. If leaks or spills are encountered, the source of the leak will be identified, leaked material will be cleaned up, and the cleaning materials will be collected and will be properly disposed.
- All hazardous material shall be stored upland in storage trailers and/or shipping containers designed to provide adequate containment. Short- term laydown of hazardous materials for immediate use shall be permitted with the same anti-spill precautions.
- Petroleum products, chemicals, fresh cement, saw water, or concrete or water contaminated by the aforementioned shall not be allowed to enter the water.

At Fort Baker, the existing concrete pier was constructed in the late 1930s and may contain creosote-treated wood. Other hazardous materials, including asbestos, lead-based paint, or polychlorinated biphenyls, may be present in structures or other improvements on-site, including treated woods. Fort Baker is also listed in the Formerly Used Defense Site database as both a Hazardous, Toxic, and

Radioactive Waste site and a Military Munitions Response Program site,¹⁸³ although the immediate project area is not among the eight Fort Baker sites with identified elevated soil concentrations of polycyclic aromatic hydrocarbons, pesticides, metals, and petroleum hydrocarbons. At the Fort Baker site, the proposed project would include limited shallow ground disturbance (i.e., grading) for construction of a new trail over an approximately 0.35-acre area.

Due to the age of existing structures at Pier 31½ and Fort Baker and the historical uses of these sites, it is expected that some routine removal and management of hazardous materials may be required during construction. Construction would comply with all applicable federal, state, and local regulations to ensure that hazardous materials are handled in a safe and lawful manner, which would reduce the potential for harmful health effects due to exposure to hazardous materials and for an accidental release of hazardous materials to the environment. These regulations are discussed further below.

Polychlorinated Biphenyls. All workers must follow Occupational Safety and Health Administration regulations governing the removal and handling of polychlorinated biphenyl products including Code of Federal Regulations Title 29 Section 1910.120 – Hazardous Waste Operations and Emergency Response and 8 California Code of Regulations Title 8 Section 5192 – Hazardous Waste Operations and Emergency Response.

Asbestos-containing Materials. Section 19827.5 of the California Health and Safety Code requires that local agencies not issue demolition or alteration permits until an applicant has demonstrated compliance with the notification requirements under applicable federal regulations regarding hazardous air pollutants, including asbestos. The Bay Area Air Quality Management District is vested by the California legislature with authority to regulate airborne pollutants, including asbestos, through both inspection and law enforcement, and is to be notified 10 days in advance of any proposed demolition or abatement work.

Notification of asbestos removal includes the names and addresses of operations and persons responsible; description and location of the structure to be demolished/alterd, including size, age and prior use, and the approximate amount of friable asbestos; scheduled starting and completion dates of demolition or abatement; nature of planned work and methods to be employed; procedures to be employed to meet air quality management district requirements; and the name and location of the waste disposal site to be used. The Bay Area Air Quality Management District randomly inspects asbestos removal operations. In addition, the Bay Area Air Quality Management District will inspect any removal operation when a complaint has been received.

The local California Occupational Safety and Health Administration office must also be notified prior to asbestos remediation. Asbestos abatement contractors must follow state regulations contained in

¹⁸³ U.S. Army Corps of Engineers, *Formerly Used Defense Sites Projects Per State, California Entry*, September 30, 2011. Available from <http://www.usace.army.mil/Missions/Environmental/FormerlyUsedDefenseSites/FUDSInventory.aspx>.

8 California Code of Regulations 1529 and 8 California Code of Regulations 341.6 through 341.14 where there is asbestos-related work involving 100 or more square feet or linear feet of asbestos-containing materials. Asbestos removal contractors must be certified as such by the Contractors Licensing Board of the State of California. The abatement workers are required to have received U.S. Environmental Protection Agency-accredited training and be certified for asbestos abatement work. The owner of the property where abatement is to occur must have a Hazardous Waste Generator Number assigned by and registered with the California Department of Health Services in Sacramento. The contractor and hauler of the material are required to file a Hazardous Waste Manifest that details the hauling of the material from the site and appropriate disposal. Pursuant to California law, the Port of San Francisco will not issue a required permit for work at the Pier 31½ site until an applicant has complied with the notice and abatement requirements described above.

Lead-based Paint. Removal of various fixtures from substrates painted with lead-based or lead-containing paint are required to be performed by workers trained in accordance with the California Division of Occupational Safety and Health Lead in Construction Standard, Title 8, Section 1532.1 training requirements. Demolition and construction would additionally need to comply with San Francisco Building Code Section 3425, which applies to buildings and steel structures on which original construction was completed prior to 1979, and which regulates any disturbance of lead-based paint. The Code requirements include provisions to eliminate the off-site migration of lead contamination and potential on-site soil contamination. The Port of San Francisco must also be notified of the removal, and signs must be posted advising adjacent property owners and/or occupants of the lead-based paint removal.

Hazardous Materials in Soil. Should unanticipated soil contamination be encountered during construction, soil would be segregated and handled in accordance with all applicable regulations for the handling and disposal of hazardous materials.

Routine Construction Chemicals. Hazardous materials that would be used during construction include fuels, lubricants and solvents needed for the fueling and maintenance of construction equipment. Storage and use of hazardous materials at the construction site could result in the accidental release of small quantities of hazardous materials, which could degrade soil and or water quality. Project construction would implement best management practices to control construction site runoff and prevent it from entering San Francisco Bay. These measures include storing chemicals in water-tight containers with appropriate secondary containment, maintaining materials and equipment for spill cleanup, and implementing spill response procedures in the event of a release.

Implementation of the regulations and procedures listed above, along with the Port's standard best management practices and other applicable federal, state, and local laws and regulations, would reduce potential impacts from routine transport, use, or disposal of hazardous materials during construction to a less-than-significant level.

Operations

Ferry operations would involve the routine use of fuel, lubricants, and solvents, as well as cleaning and maintenance chemicals. Ferry operations at Pier 31½ and Fort Baker would occur in adherence with site-specific Spill Prevention, Control, and Countermeasure Plans (required as part of the concessioner agreement for both sites), which would outline how potentially-hazardous materials would be managed to comply with all applicable oversight regulations, including, but not limited to, discharge prevention measures, discharge or drainage controls, countermeasures for accidental releases and methods of disposal (refer to Impact HY-1 in Section E.15, Hydrology and Water Quality, for additional discussion of water quality regulations).

Given the negligible increase in hazardous materials use associated with the minor increase in ferry service under the proposed project and its compliance with federal, state, and local laws and regulations, there would be less-than-significant impacts related to routine transport, use, or disposal of hazardous materials, including accidental releases.

Impact HZ-2: The proposed project is located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5. (Less than Significant)

The Pier 31½ site is not listed in the GeoTracker or EnviroStor database of hazardous material sites.^{184,185} Fort Baker is listed in the Formerly Used Defense Site database as both a Hazardous, Toxic, and Radioactive Waste site and a Military Munitions Response Program site,¹⁸⁶ although the project area is not among the eight Fort Baker sites with identified elevated soil concentrations of polycyclic aromatic hydrocarbons, pesticides, metals, and petroleum hydrocarbons. Furthermore, the proposed project includes only minimal grading (0.35 acre) at Fort Baker for trail construction and would have a low potential to encounter hazardous materials, if any, in the subsurface. The proposed project would not affect ongoing investigations and cleanups of any listed hazardous materials sites. Therefore, the proposed project would result in less-than-significant impacts related to its location on a listed hazardous materials site.

¹⁸⁴ California Department of Toxic Substances Control, GeoTracker Database, accessed June 23, 2017. Available from <http://geotracker.waterboards.ca.gov/>.

¹⁸⁵ California Department of Toxic Substances Control, EnviroStor Database, accessed September 5, 2013. Available from <http://www.envirostor.dtsc.ca.gov/public/>.

¹⁸⁶ U.S. Army Corps of Engineers, *Formerly Used Defense Sites Projects Per State*, September 30, 2011. Available from <http://www.usace.army.mil/Missions/Environmental/FormerlyUsedDefenseSites/FUDSInventory.aspx>.

Impact HZ-3: The proposed project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. (Less than Significant)

The proposed project would not significantly impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan, including but not limited to the following plans:

- **The City and County of San Francisco Emergency Management Program.** The City and County of San Francisco Emergency Management Program is a jurisdiction-wide system that provides emergency management actions for the prevention of, preparedness for, response to, and recovery from any emergency or disaster within the City and County of San Francisco (including Pier 31½).
- **Water Emergency Transportation Authority's Water Transportation System Management Plan.** The Water Emergency Transportation Authority is a regional agency authorized by the state to operate a comprehensive Bay Area public water transit system. In 2009, the Water Emergency Transportation Authority adopted the Emergency Water Transportation System Management Plan, which complements and reinforces other transportation emergency plans that will enable the Bay Area to restore mobility after a regional disaster.
- **Tsunami Response Plans.** The National Oceanic and Atmospheric Administration operates the tsunami warning system that serves both San Francisco and Marin counties, among other areas. Tsunami warning procedures for the counties of San Francisco and Marin are provided in their respective tsunami emergency response plans.^{187,188}

By adhering to the provisions of the California Building Standards Code and the San Francisco Building Code (which require additional life-safety protections for new construction), and by maintaining adequate emergency vehicle access throughout construction (as required by local ordinances and the conditions of permit approvals), proposed project construction and operation at Pier 31½ would not impede or interfere with implementation of the City and County of San Francisco Emergency Management Program or other emergency response plans for the project area.

The pier improvements and berthing access at Fort Baker would increase access for emergency responders at the site. The proposed project would not physically interfere with emergency response or emergency evacuation at the Fort Baker site.

Based on the low likelihood of a significant seiche or tsunami event at Pier 31½ or Fort Baker, and taking into consideration the National Oceanic and Atmospheric Administration's tsunami warning system and the emergency response plans for San Francisco and Marin, there would be no impact on the respective

¹⁸⁷ City and County of San Francisco, *Emergency Response Plan Tsunami Response Annex*, March 2011. Available from <http://www.sfdem.org/modules/ShowDocument.aspx?documentid=1115>.

¹⁸⁸ Marin County Sheriff Office of Emergency Services, *Tsunami Annex Marin Operational Area Emergency Operations Plan*, January 2015. Available from <http://www.marinsheriff.org/assets/downloads/01.30.2015-Tsunami-AnnexUH.pdf>.

tsunami response plans for San Francisco and Marin counties. The proposed project would not block any evacuation routes or otherwise affect evacuation from Pier 31½ or Fort Baker.

Based on the analysis presented above, the proposed project would result in less-than-significant impacts related to emergency response or evacuation plans.

Impact HZ-4: The proposed project would not expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands. (Less than Significant)

The Pier 31½ site is not within a wildland fire area or mapped fire hazard severity areas for San Francisco.¹⁸⁹ San Francisco ensures fire safety and emergency accessibility within new and existing developments through provisions of its building and fire codes. The proposed improvements at Pier 31½ would conform to these standards, ensuring that life safety protections are included as part of the proposed project. Therefore, there would be less-than-significant impacts pertaining to risk of loss, injury, or death involving wildland fire from proposed improvements at Pier 31½, as the site is not within a fire hazard area.

Fort Baker is within a high wildland fire risk area, as identified through the Marin County Fire Department Hazard Model.¹⁹⁰ As described in the 2008 Golden Gate National Recreation Area *Operational Strategy for the Fire Management Plan*, fire management issues at Fort Baker include fire hazards from dense stands of nonnative trees, and fuel hazards (i.e., live and dead vegetation that has accumulated and increases the likelihood of unusually large wildland fires) around buildings. Fire management actions at Fort Baker include prescribed burns in the Marin Headlands to manage coastal scrub, prescribed test burns to enhance mission blue butterfly habitat, and the reduction of fuel hazards near historic structures and heavily developed areas that receive high visitation.¹⁹¹ The proposed project would not affect these or other fire management activities at Fort Baker. Proposed project construction would occur overwater on the pier and along the shoreline, away from areas with fire-susceptible trees and vegetation. The proposed project would not include new facilities or implementation of any activities that would increase the risk of fire. Furthermore, Fort Baker is adequately served by existing fire response services (as discussed under Section E.12, Public Services). Therefore, the proposed project would not expose people or structures to a significant risk of loss, injury, or death involving wildland fires, and the impact would be less than significant.

¹⁸⁹ California Department of Forestry and Fire Protection, *Fire Hazard Severity Zones in LRA San Francisco County*, November 2008.

¹⁹⁰ National Park Service, *Operational Strategy for the Fire Management Plan*, Golden Gate National Recreation Area, April 2008. Available from https://www.nps.gov/goga/learn/management/upload/fire_fmp_op_strat_cover.pdf.

¹⁹¹ National Park Service, *Marin Headlands and Fort Baker Transportation Infrastructure and Management Plan Final Environmental Impact Statement*, March 2009. Available from https://www.nps.gov/goga/learn/management/upload/MH_FB-TIMP-Final-EIS_Main-Document.pdf.

Impact C-HZ: The proposed project would not make a considerable contribution to any cumulative significant effects related to hazardous materials. (Less than Significant)

Environmental impacts related to hazards and hazardous materials are generally restricted to the project site and immediate vicinity due to the site-specific nature of hazardous materials in building materials and the subsurface. As outlined in this section, the proposed project would not result in significant impacts related to hazards or hazardous materials. There are no known projects under development within 0.25 mile of Fort Baker. There are three potential cumulative projects in the vicinity of the Pier 31½ site listed in Table 6 that could affect hazards or hazardous materials: ongoing Port pier maintenance dredging; ongoing routine repair and maintenance of Port facilities; and the Seawall Resiliency project. As is the case for the proposed project, construction and operation of these nearby cumulative projects would be required to comply with applicable local, state, and federal regulations regarding the storage, handling, and disposal of hazardous materials and emergency access. With respect to wildland fire, all projects in San Francisco must comply with the fire code, and any projects within Fort Baker would comply with the fire plan discussed in Impact HZ-4. Therefore, the proposed project, in combination with other reasonably foreseeable projects, would result in less-than-significant cumulative hazards and hazardous materials impacts.

<i>Topics:</i>	<i>Potentially Significant Impact</i>	<i>Less Than Significant with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>	<i>Not Applicable</i>
17. MINERAL AND ENERGY RESOURCES— Would the project:					
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Encourage activities which result in the use of large amounts of fuel, water, or energy, or use these in a wasteful manner?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Pier 31½ and the Fort Baker pier are located on fill or over water with no known mineral resources. Neither site has been delineated as a mineral resource recovery site on a local general plan, specific plan, or other land use plan.¹⁹² Therefore, Topics 17(a) and 17(b) are not applicable.

¹⁹² California Division of Mines and Geology, *Open File Report 96-03* and *Special Report 146*, Parts I and II, Generalized Mineral Land Classification Map of the South San Francisco Bay Production-Consumption Region, 1996.

Impact ME-1: The proposed project would not encourage activities that would result in the use of large amounts of fuel, water, or energy, or use these resources in a wasteful manner. (Less than Significant)

Construction of the proposed project would require the use of energy resources, such as water, electricity, and diesel fuel. These energy resources would be used by construction equipment and construction workers' vehicles at both the Pier 31½ and Fort Baker sites. However, construction of the proposed project would adhere to applicable regulations, including the Port's Green Building Standards at the Pier 31½ site, and employ best management practices to ensure that these resources would be used conservatively.¹⁹³ The Green Building Standards require minimizing waste of energy, water, and other resources and reducing greenhouse gas emissions from project construction and operations in the City.

Operation of the proposed project would also require the use of water, electricity, and diesel fuel. The largest use of energy in terms of operations would be diesel fuel to power the ferries. The overall number of peak day ferry trips would increase from 27 to 29 under the proposed project; however, the proposed project includes Park Service contract requirements to use more efficient Tier 3 engines, to reduce overall fuel use, and to limit idling, decreasing fuel consumption. The Port's Green Building Standards also apply to operations of the proposed project at Pier 31½. For example, the Green Building Standards require that commercial projects achieve a minimum 30 percent reduction in the use of indoor potable water. The proposed project would modernize both the Pier 31½ and Fort Baker sites to include design features that limit resource use, such as high-efficiency lighting and water-saving control measures (see Section E.11, Utilities and Service Systems).

For the reasons noted above, the proposed project would not result in the use of large amounts of fuel, water, or energy, or use these resources in a wasteful manner. Impacts would be less than significant.

Impact C-ME: The proposed project, in combination with other past, present, or reasonably foreseeable projects, would not result in a cumulative impact on mineral and energy resources. (Less than Significant)

As discussed above, no known mineral deposits or resource recovery areas exist at the proposed project sites; therefore, the proposed project would not contribute to cumulative impacts on mineral resources. While the proposed project would use energy resources, both the proposed project and other regional projects would be subject to City of San Francisco and state laws mandating efficiencies and reductions in overall resource consumption. Therefore, the proposed project, in combination with other reasonably foreseeable projects, would result in a less-than-significant cumulative impact on mineral or energy resources.

¹⁹³ Port of San Francisco, 2016 *Port of San Francisco Green Building Standards Code*, effective January 1, 2017.

<i>Topics:</i>	<i>Potentially Significant Impact</i>	<i>Less Than Significant with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>	<i>Not Applicable</i>
----------------	---	---	---	----------------------	---------------------------

18. AGRICULTURE AND FOREST RESOURCES: In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board.

—Would the project

- | | | | | | |
|--|--------------------------|--------------------------|--------------------------|--------------------------|-------------------------------------|
| a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use? | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> |
| b) Conflict with existing zoning for agricultural use, or a Williamson Act contract? | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> |
| c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220[g]), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104[g])? | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> |
| d) Result in the loss of forest land or conversion of forest land to non-forest use? | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> |
| e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or forest land to non-forest use? | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> |

The proposed project site at Pier 31½ is zoned light industrial, and the proposed project site at Fort Baker is part of the National Park System.¹⁹⁴ No farmland, lands subject to a Williamson Act contract, forest land, or timberland exist in the proposed project area.¹⁹⁵ The proposed project would not result in the conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural use. Because the proposed project sites are in existing developed areas and do not contain farmland, land zoned for agricultural use, forest land, or timberland, none of the above criteria (Topics 18[a] through 18[e]) are applicable.

¹⁹⁴ City and County of San Francisco, San Francisco Municipal Code (current through Ordinance 70-12, File No. 130085), approved April 23, 2013, effective May 23, 2013. Available from <http://www.amlegal.com/library/ca/sfrancisco.shtml>.

<i>Topics:</i>	<i>Potentially Significant Impact</i>	<i>Less Than Significant with Mitigation Incorporated</i>	<i>Less Than Significant Impact</i>	<i>No Impact</i>	<i>Not Applicable</i>
19. MANDATORY FINDINGS OF SIGNIFICANCE—					
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Does the project have impacts that are individually limited, but cumulatively considerable? (“Cumulatively considerable” means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.)	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

As discussed in the previous sections (E.1 through E.17), impacts as a result of the proposed project are anticipated to be less than significant or less than significant with mitigation in the areas discussed. The foregoing analysis identifies potentially significant impacts related to cultural resources, noise, air quality, and biological resources, which would be mitigated through implementation of mitigation measures, as described in the following paragraphs and in more detail in Section F, Mitigation Measures and Improvement Measures.

As described in Section E.3, Cultural Resources, construction of the proposed project could result in a substantial adverse change on historic and archeological resources. The proposed project could also disturb human remains. Implementation of **Mitigation Measures M-CR-2, Accidental Discovery of Archaeological Resources**, and **M-CR-5, Tribal Cultural Resources Interpretive Program**, would reduce the impacts to less-than-significant levels. Therefore, the proposed project would not result in a significant impact through the elimination of important examples of major periods of California history or prehistory.

As described in Section E.6, Noise, construction of the proposed project has the potential to impact the historic bulkhead buildings at the Pier 31½ site from vibration during construction. Implementation of **Mitigation Measure M-NO-2, Conduct Vibration Monitoring at Pier 31½**, would reduce impacts to a less-than-significant level.

As described in Section E.7, Air Quality, the proposed project at Pier 31½ has the potential to expose sensitive receptors to substantial concentrations of diesel emissions, resulting in a significant air quality impact. Implementation of **Mitigation Measure M-AQ-4, Best Available Control Technology for Diesel Generators at Pier 31½**, would reduce emissions by 89 to 94 percent compared to equipment with engines that do not meet any emission standards and without a Verified Diesel Emissions Control Strategy, and impacts would be less than significant.

As described in Section E.13, Biological Resources, the proposed project has the potential to affect special status bats at the Pier 31½ site and nesting birds at both project sites during construction. Implementation of **Mitigation Measures M-BI-1a, Avoidance and Minimization Measures for Special Status Bats at Pier 31½**, and **M-BI-1b, Nesting Bird Protection Measures**, would reduce the impacts on special status bats and nesting birds to less-than-significant levels.

Both long-term and short-term environmental effects, including substantial adverse effects on human beings, associated with the proposed project would be less than significant or less than significant with mitigation, as discussed under each environmental topic. Each environmental topic area includes an analysis of cumulative impacts. This initial study concludes that cumulative impacts for all environmental topic areas would be less than significant.

F. MITIGATION MEASURES AND IMPROVEMENT MEASURES

The project proponent has agreed to implement the following mitigation and improvement measures. Mitigation measures identified below are necessary to reduce the significant effects of the proposed project to a less-than-significant level. Improvement measures would further reduce the effect of the proposed project's less-than-significant impacts.

Mitigation Measure M-CR-2: Accidental Discovery of Archaeological Resources

The following mitigation measure is required to avoid any potential adverse effect from the proposed project on accidentally discovered buried or submerged historical resources as defined in CEQA Guidelines Section 15064.5(a) and (c). The project proponent shall distribute the Planning Department archaeological resource "ALERT" sheet to the project prime contractor; any project subcontractor (including demolition, excavation, grading, foundation, pile driving, etc. firms); and any utilities firm involved in soil-disturbing activities within the project site. Prior to any soils disturbing activities being undertaken each contractor is responsible for ensuring that the "ALERT" sheet is circulated to all field personnel including, machine operators, field crew, pile drivers, supervisory personnel, etc. The project proponent shall provide the Environmental Review Officer and the Port of San Francisco with a signed affidavit from the responsible parties (prime contractor, subcontractor(s), and utilities firm) to the Environmental Review Officer confirming that all field personnel have received copies of the "ALERT" Sheet.

Should any indication of an archaeological resource be encountered during any soils disturbing activity of the project, the project Head Foreman and/or project proponent shall immediately notify the Environmental Review Officer and the Port of San Francisco and shall immediately suspend any soils disturbing activities in the vicinity of the discovery until the Environmental Review Officer has determined what additional measures should be undertaken.

If the Environmental Review Officer determines that an archaeological resource may be present within the project site, the project proponent shall retain the services of an archaeological consultant from the pool of qualified archaeological consultants maintained by the Planning Department archaeologist. The archaeological consultant shall advise the Environmental Review Officer and the Port of San Francisco as to whether the discovery is an archaeological resource, retains sufficient integrity, and is of potential scientific/historical/cultural significance. If an archaeological resource is present, the archaeological consultant shall identify and evaluate the archaeological resource. The archaeological consultant shall make a recommendation as to what action, if any, is warranted. Based on this information, the Environmental Review Officer may require, if warranted, specific additional measures to be implemented by the project proponent.

Measures might include: preservation in situ of the archaeological resource; an archaeological monitoring program; or an archaeological testing program. If an archaeological monitoring program or archaeological testing program is required, it shall be consistent with the Environmental Planning

division guidelines for such programs. The Environmental Review Officer may also require that the project proponent immediately implement a site security program if the archaeological resource is at risk from vandalism, looting, or other damaging actions.

The project archaeological consultant shall submit a Final Archaeological Resources Report to the Environmental Review Officer and the Port of San Francisco that evaluates the historical significance of any discovered archaeological resource and describes the archaeological and historical research methods employed in the archaeological monitoring/data recovery program(s) undertaken. Information that may put at risk any archaeological resource shall be provided in a separate removable insert within the final report.

Copies of the Draft Final Archaeological Resources Report shall be sent to the Environmental Review Officer for review and approval. Once approved by the Environmental Review Officer, copies of the Final Archaeological Resources Report shall be distributed as follows: the California Archaeological Site Survey Northwest Information Center shall receive one copy, and the Environmental Review Officer shall receive a copy of the transmittal of the Final Archaeological Resources Report to the Northwest Information Center. The Environmental Planning division of the Planning Department shall receive one bound copy; one unbound copy; and one unlocked, searchable PDF copy on CD of the Final Archaeological Resources Report, along with copies of any formal site recordation forms (CA DPR 523 series) and/or documentation for nomination to the National Register of Historic Places/California Register of Historical Resources. In instances of high public interest or interpretive value, the Environmental Review Officer may require a different final report content, format, and distribution than that presented above.

Mitigation Measure M-CR-4: Tribal Cultural Resources Interpretive Program

If the Environmental Review Officer determines that a significant archaeological resource is present, and if in consultation with the affiliated Native American tribal representatives, the Environmental Review Officer determines that the resource constitutes a tribal cultural resource and that the resource could be adversely affected by the proposed project, the proposed project shall be redesigned so as to avoid any adverse effect on the significant tribal cultural resource, if feasible. If the Environmental Review Officer, in consultation with the affiliated Native American tribal representatives and the project proponent, determines that preservation-in-place of the tribal cultural resources is not a sufficient or feasible option, the project proponent shall implement an interpretive program of the tribal cultural resources in consultation with affiliated tribal representatives. An interpretive plan produced in consultation with the Environmental Review Officer and affiliated tribal representatives, at a minimum, and approved by the Environmental Review Officer, would be required to guide the interpretive program. The plan shall identify, as appropriate, proposed locations for installations or displays, the proposed content and materials of those displays or installation, the producers or artists of the displays or installation, and a long-term maintenance program. The interpretive program may include artist installations, preferably by local Native American artists, oral histories with local Native Americans, artifacts displays and

interpretation, and educational panels or other informational displays. In the event that construction activities disturb unknown archaeological sites that are considered tribal cultural resources, any inadvertent damage would be considered a significant impact.

Mitigation Measure M-NO-2: Conduct Vibration Monitoring at Pier 31½

The project proponent would require that a qualified professional evaluate the subject structure(s) prior to the pile driving to assess their susceptibility to vibration impacts and provide pre-construction bracing if warranted. Based on the results of the evaluation, the professional shall develop a vibration control plan. The plan would include set of site-specific vibration attenuation measures that would be implemented under the supervision of a qualified acoustical consultant during the project construction. These attenuation measures would include as feasible, in consideration of technical and structural requirements and conditions, implementing “quiet” pile driving technology, such as predrilling piles, using sonic pile drivers, or using more than one pile driver to shorten the total duration of pile driving. During construction, the construction contractor will conduct vibration monitoring when construction activities occur within 50 feet of the historic Pier 33 bulkhead building. If monitoring indicates that peak particle velocity caused by construction activities is approaching 0.12 inches per second, construction activities would be halted and a plan would be developed to reduce construction activities. Other effective strategies may also be required to the extent necessary to achieve a peak particle velocity vibration level at bulkhead buildings of less than the level of 0.12 inches per second.

Mitigation Measure M-AQ-4: Best Available Control Technology for Diesel Generators at Pier 31½

The project proponent shall ensure that the backup diesel generator meets or exceeds one of the following emission standards for particulate matter: 1) Tier 4-certified engine; or 2) Tier 2- or Tier 3-certified engine that is equipped with a California Air Resources Board Level 3 Verified Diesel Emissions Control Strategy. A non-verified diesel emission control strategy may be used if the filter has the same particulate matter reduction as the identical California Air Resources Board-verified model and if the Bay Area Air Quality Management District approves of its use. The project proponent shall submit documentation of compliance with the Bay Area Air Quality Management District New Source Review permitting process (Regulation 2, Rule 2, and Regulation 2, Rule 5) and the emission standard requirement of this mitigation measure to the Planning Department for review and approval prior to issuance of a permit for a backup diesel generator from any City agency.

Mitigation Measure M-BI-1a: Avoidance and Minimization Measures for Special Status Bats at Pier 31½

The project proponent will implement the following measures:

- Demolition within Pier 31 and 33 bulkhead buildings shall occur when bats are active, approximately between the periods of March 1 to April 15 and August 15 to October 15; outside of bat maternity roosting season (approximately April 15 – August 15) and outside of months of winter torpor (approximately October 15 – February 28), to the extent feasible.

- If demolition within Pier 31 and 33 bulkhead buildings during the periods when bats are active is not feasible, a qualified biologist will survey the project site to identify if active bat roosts being used for maternity or hibernation purposes are present. If so, a no disturbance buffer of 100 feet shall be established around these roost sites until they are determined to be no longer active by the qualified biologist.
- The qualified biologist shall be present demolition within Pier 31 and 33 bulkhead buildings if active bat roosts are present. Structures with active roosts shall be disturbed only when no rain is occurring or is forecast to occur for 3 days and when daytime temperatures are at least 50°F.
- Removal of structures containing or suspected to contain active bat roosts shall be dismantled under the supervision of the qualified biologist in the evening and after bats have emerged from the roost to forage. Structures shall be partially dismantled to significantly change the roost conditions, causing bats to abandon and not return to the roost.

Mitigation Measure M-BI-1b: Nesting Bird Protection Measures

Nesting birds and their nests shall be protected during construction by use of the following measures:

- Removal of trees, scrub vegetation and structures shall occur outside the bird nesting season (February 1 to August 30), to the extent feasible.
- If removal of trees, scrub vegetation or structures during bird nesting season cannot be fully avoided, a qualified wildlife biologist shall conduct preconstruction nesting bird surveys within 7 days prior to the start of such activities or after any construction breaks of 14 days or more. Surveys shall be performed for the project site and suitable habitat within 250 feet of the project site in order to locate any active passerine (perching bird) nests and within 500 feet of the project site to locate any active raptor (birds of prey) nests or double-crested cormorant or heron rookeries.
 - At Pier 31½, if it is determined that bird nesting habitat is only present for gulls, surveys may be conducted actively during construction from April through August during gull nesting season. Any old nests, potential nests, or nests under construction (but not active) shall be removed.
- If active nests are located during the preconstruction bird nesting survey, the wildlife biologist shall evaluate if the schedule of construction activities could affect the active nests and the following measures shall be implemented based on their determination:
 - If construction is not likely to affect the active nest, it may proceed without restriction; however, a biologist shall regularly monitor the nest to confirm there is no adverse effect and may revise their determination at any time during the nesting season. In this case, the following measure would apply.
 - If construction may affect the active nest, the biologist shall establish a no disturbance buffer. Typically, these buffer distances are between 25 feet and 250 feet for passerines and between 300 feet and 500 feet for raptors. These distances may be adjusted depending on

the level of surrounding ambient activity (e.g., if the project area is adjacent to a road or active trail) and if an obstruction, such as a building, is within line-of-sight between the nest and construction. For bird species that are federally and/or state-listed sensitive species (i.e., fully protected, endangered, threatened, species of special concern), a proposed project representative, supported by the wildlife biologist, shall consult with the U.S. Fish and Wildlife Service and/or California Department of Fish and Wildlife regarding modifications to nest buffers, prohibiting construction within the buffer, modifying construction, and removing or relocating active nests that are found on the site.

- Removing inactive passerine nests may occur at any time. Inactive raptor nests shall not be removed unless approved by the U.S. Fish and Wildlife Service and/or California Department of Fish and Wildlife.
- Removing or relocating active nests shall be coordinated by the project representative with the U.S. Fish and Wildlife Service and/or California Department of Fish and Wildlife, as appropriate, given the nests that are found on site.
- Any birds that begin nesting within the project area and survey buffers amid construction activities are assumed to be habituated to construction-related or similar noise and disturbance levels and no work exclusion zones shall be established around active nests in these cases.

Improvement Measure I-TR-2a: Provide Information on Active Transportation and Transit Routes to/from the Pier 31½ Site

The project proponent will require the concessioner to provide information regarding pedestrian, bicycle, and transit travel to/from the embarkation site to both employees and in advance to visitors. This may include maps designating preferred pedestrian, bicycle or transit routes to/from the site, maps indicating where City-provided bicycle facilities or transit stops are present, and time estimates for walking or biking to common destinations, such as BART stations, Union Square, Pier 39, or other tourist destinations. This information would be presented on tickets and information websites, as well as distributed via mail or email to all ticketed visitors.

Improvement Measure I-TR-2b: Install Multimodal Wayfinding Kiosk and Signage at the Pier 31½ Site

The project proponent will add a multimodal wayfinding kiosk that may include maps, signs, or digital displays to provide visitors information on various travel options and times. The kiosk will be located near the site entrance/exit to the Pier 31½ site. In addition to a centralized kiosk, signage could be placed at the site entrance with directional arrows indicating walk times to nearby destinations or transit stops.

Improvement Measure I-NO-1: Construction Noise Minimization Plan for Pier 31½

The project proponent shall develop a construction noise minimization plan that requires the following:

- Construction contractors shall specify noise-reducing construction practices and measures that will be employed to reduce construction noise from pile driving and construction activities. The practices and measures specified by the project proponent will be reviewed and approved by the City prior to the issuance of building permits. Practices and measures that can be used to limit noise include but are not limited to those listed below:
 - Avoid simultaneous use of equipment that exceeds 90 dBA, particularly impact and vibratory pile drivers
 - Install noise mufflers to stationary equipment and impact tools that are no less effective than those provided by the manufacturer
 - Use construction equipment with low noise emission ratings
 - Locate equipment, materials, and staging areas as far as practicable from sensitive receptors
 - Install barriers around particularly loud activities at the construction site to eliminate the line of sight between the source of noise and nearby sensitive receptors, which could reduce noise up to 10 dBA based on the configuration of the site and equipment used.¹⁹⁶
 - Prohibit unnecessary idling of vehicles or equipment
 - Require applicable construction-related vehicles or equipment to use designated truck routes to access the proposed project site
 - Restrict construction activities between 7:00 AM to 8:00 PM Monday through Saturday

Improvement Measure I-AQ-1a: Use Cleaner Construction Equipment

The project proponent shall develop a plan demonstrating that the off-road equipment (more than 50 horsepower) to be used in the construction project (i.e., owned, leased, and subcontractor vehicles) would achieve a project wide fleet-average 20 percent nitrogen oxide (NOx) reduction and 45 percent particulate matter (PM) reduction compared to the most recent California Air Resources Board fleet average. Acceptable options for reducing emissions include the use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, add-on devices such as particulate filters, and/or other options as such become available.

Improvement Measure I-AQ-1b: Use Cleaner Engines on Tugboats

The project proponent shall use tugboats with Tier 4 propulsion engines and Tier 3 auxiliary engines.

¹⁹⁶ The Federal Highway Administration's *Roadway Construction Noise Model Users' Guide* gives the following "rules of thumb" for estimating noise attenuation of barriers at construction sites:

3 dBA - if a noise barrier or other obstruction (like a dirt mound) just barely breaks the line-of-sight between the noise source and the receptor;

5 dBA - if the noise source is partly enclosed OR shielded with a barrier with some gaps located close to the source;

8 dBA - if the noise source is completely enclosed OR completely shielded with a solid barrier located close to the source;

10 dBA - if the noise source is completely enclosed AND completely shielded with a solid barrier located close to the source;

15 dBA - if a building stands between the noise source and receptor and completely shields the noise source.

Improvement Measure I-BI-1a: Pile Driving Work Windows

Pile driving will occur between July 1 and November 30 at the Pier 31½ site and between July 1 and September 30 at the Fort Baker site.

Improvement Measure I-BI-1b: Noise Monitoring Plan

The project proponent will develop and implement a marine noise monitoring plan which would be subject to review and approval by the National Marine Fisheries Service. As part of this plan, the following measures will be implemented:

- *Equipment Controls:* The proposed project will be required to bring loud mechanical equipment online slowly (employ a “soft-start”).
- *Noise Monitoring:* A trained acoustical specialist will conduct underwater noise monitoring during marine construction to ensure that pile driving noise levels do not exceed the levels identified through noise modeling for the proposed project. If noise levels are exceeded, the proposed project will implement cushion blocks in the hammer to reduce sound levels and prevent exceedance of the levels projected through noise modeling, and noise level exceedances will be reported to the National Marine Fisheries Service.

Improvement Measure I-BI-1c: Marine Mammal Safety Zone

The project proponent will maintain a 500-meter safety zone around sound sources in the event that the sound level is unknown or cannot be adequately predicted. This will be required at the onset of construction, prior to confirming noise levels through noise monitoring (as required through **Improvement Measure I-BI-1b, Noise Monitoring Plan**).

A qualified marine biologist on shore or by boat will survey the safety zone to ensure that no marine mammals are within the zone before pile driving begins. If a marine mammal is observed within the safety zone before pile driving begins, pile driving will be delayed until the marine mammals move out of the area.

If marine mammals enter the safety zone after pile driving of a segment has begun, pile driving will continue. The biologist will monitor and record the species and number of individuals observed, and make note of their behavior patterns. If the animal appears distressed, and if it is operationally safe to do so, pile driving will cease until the animal leaves the area. Prior to the initiation of each new pile driving episode, the area will again be thoroughly surveyed by the biologist.

G. PUBLIC NOTICE AND COMMENT

On September 13, 2017, the Planning Department mailed a “Notification of Project Receiving Environmental Review” to property owners and residents of property within 300 feet of the project sites, responsible and trustee agencies, and interested parties. No comments were received in response to the notification.

On December 6, 2017, the Planning Department issued a “Notice of Availability of and Intent to Adopt a Negative Declaration” in accordance with CEQA Guidelines section 15072. In response to this notice, the City of Sausalito filed an appeal of the preliminary mitigated negative declaration on December 27, 2018. The City of Sausalito’s primary concern is that Fort Baker ferry passengers may leave Fort Baker and travel to downtown Sausalito, exacerbating overcrowded conditions within Sausalito’s downtown and waterfront. To evaluate this concern, a supplemental transportation and circulation study was performed and is included as Appendix B. The study concluded that the project is not likely to contribute substantially to congestion issues and conflicts between bicycles, pedestrians, and vehicles in Sausalito. FMND section E.5, Transportation and Circulation, has been revised to reflect this additional analysis, which does not change the less-than-significant findings of the PMND concerning transportation and circulation.

No other comments were received.

H. DETERMINATION

On the basis of this Initial Study:

- ☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.
- ☒ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.
- ☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.
- ☐ I find that the proposed project MAY have a “potentially significant impact” or “potentially significant unless mitigated” impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.
- ☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, no further environmental documentation is required.

Appendix A
Federal and State Listed Species with
the Potential to Occur in the Study Area

TABLE A-1
FEDERALLY LISTED SPECIES WITH THE POTENTIAL TO OCCUR IN THE STUDY AREA
(FISH AND MARINE MAMMALS LISTED IN TABLE A-4)

Species	Federal	State	Habitat Association	Potential to Occur	
				Pier 31 ½	Fort Baker
Invertebrates					
San Bruno elfin butterfly (<i>Callophrys mossii bayensis</i>)	E	-	Rocky outcrops and cliffs in coastal scrub on the San Francisco Peninsula that support its host plant, stonecrop (<i>Sedum spathulifolium</i>).	No potential to occur. Habitat not present.	
Bay checkerspot butterfly (<i>Euphydryas editha bayensis</i>)	T	-	Shallow, serpentine-derived or similar soils in the San Francisco Bay Area. Primary host plant is the native plantain (<i>Plantago erecta</i>). Populations are known only from San Mateo and Santa Clara counties.	No potential to occur. Habitat not present.	Very low potential to occur. Coastal scrub habitat may be marginally suitable for host species. No recorded observations in the study area.
Black abalone (<i>Haliotes cracherodii</i>)	E	-	Rocky intertidal and subtidal habitats.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
White abalone (<i>Haliotes sorenseni</i>)	E	-	Open low and high relief rock or boulder habitat that is interspersed with sand channels.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Mission blue butterfly (<i>Icaricia icarioides missionensis</i>)	E	-	Coastal chaparral and grasslands that support its host plants, perennial lupines (<i>Lupinus albifrons</i> , <i>L. Variicolor</i> , and <i>L. Formosus</i>).	No potential to occur. Habitat not present.	Low potential to occur. Coastal scrub habitat may be marginally suitable for host species. Recorded observations in grasslands of Marin Headlands.
Callippe silverspot butterfly (<i>Speyeria callippe callippe</i>)	E	-	Grasslands that support its host plant, Johnny jump-up (<i>Viola pedunculata</i>). Populations are known only from San Bruno Mountain on the San Francisco Peninsula.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Myrtle’s silverspot butterfly (<i>Speyeria zerene myrtleae</i>)	E	-	Dunes, scrub, and grasslands immediately adjacent to the coast. Populations are known only from Marin County.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.

Species	Federal	State	Habitat Association	Potential to Occur	
				Pier 31 ½	Fort Baker
Amphibians					
California tiger salamander (<i>Ambystoma californiense</i>)	T	T	Cismontane woodland, meadow and seep, riparian woodland, valley and foothill grassland.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
California red-legged frog (<i>Rana draytonii</i>)	T	-	Streams, deep pools, backwaters within streams and creeks, ponds, marshes, sag ponds, dune ponds, and lagoons and adjacent uplands.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Reptiles					
Loggerhead turtle (<i>Caretta caretta</i>)	T	-	Open ocean, seldom along the California coast.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Green turtle (<i>Chelonia mydas</i>)	T	-	Warm-water bays and lagoons.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Leatherback turtle (<i>Dermochelys coriacea</i>)	E	-	Open ocean, California coast, bays, and estuaries.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Olive Ridley sea turtle (<i>Lepidochelys olivacea</i>)	T	-	Bay and lagoons, seldom in California.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Alameda whipsnake (<i>Masticophis lateralis euryxanthus</i>)	T	T	Chaparral and scrub habitats, adjacent grassland, oak savanna, and woodland habitats. Mostly south-facing slopes and ravines with rock outcrops, deep crevices, or abundant rodent burrows.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
San Francisco garter snake (<i>Thamnophis sirtalis tetrataenia</i>)	E	E	Wetlands or grasslands near ponds, marshes, and sloughs.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Birds					
Marbled murrelet (<i>Brachyramphus marmoratus</i>)	T	E	Coastal waters; nests inland in old-growth redwood forests and in Marin County in Douglas fir forests.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Western snowy plover (<i>Charadrius alexandrinus nivosus</i>)	T	SSC	Flat, open coastal beaches, dunes, and near stream mouths.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
California Ridgway's rail (<i>Rallus longirostris obsoletus</i>)	E	E; FP	Saltmarshes along San Francisco Bay.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
California least tern (<i>Sternula antillarum brownii</i>)	E	E; FP	Shallow estuaries and lagoons.	No potential to occur. Habitat not present.	Low potential to occur. Known to occur in Horseshoe Bay.

Species	Federal	State	Habitat Association	Potential to Occur	
				Pier 31 ½	Fort Baker
Northern spotted owl (<i>Strix occidentalis caurina</i>)	T	-	Old-growth forests or mixed stands of old-growth and mature trees. Occasionally in younger forests w/patches of big trees. High, multistory canopy dominated by big trees, many trees w/cavities or broken tops, woody debris, and space under canopy.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Yellow-headed blackbird (<i>Xanthocephalus xanthocephalus</i>)	-	SC	Nests in freshwater emergent wetlands with dense vegetation and deep water. Often along borders of lakes or ponds. Nests only where large insects such as odonata are abundant, nesting timed with maximum emergence of aquatic insects.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Mammals					
Salt marsh harvest mouse (<i>Reithrodontomys raviventris</i>)	E	E, FP	Saline emergent wetlands only; requires pickleweed.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Plants					
Presidio manzanita (<i>Arctostaphylos montana</i> ssp. <i>ravenii</i>)	E	E; 1B.1	Serpentine soils in chaparral, coastal prairie, and coastal scrub. Known from only one extant native occurrence at the Presidio in San Francisco.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Franciscan manzanita (<i>Arctostaphylos franciscana</i>)	E	1B.1	Chaparral, ultramafic.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Pallid manzanita (<i>Arctostaphylos pallida</i>)	T	E; 1B.1	Broadleafed upland forest, closed-cone coniferous forest, chaparral, cismontane woodland, coastal scrub. Grows on uplifted marine terraces on siliceous shale or thin chert. May require fire.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Marsh sandwort (<i>Arenaria paludicola</i>)	E	E; 1B.1	Sandy, openings, freshwater or brackish marshes and swamps. Populations are known only from Santa Cruz County.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Tiburon mariposa lily (<i>Calochortus tiburonensis</i>)	T	T; 1B.1	Valley and foothill grassland. On open, rocky, slopes in serpentine grassland.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Tiburon paintbrush (<i>Castilleja affinis</i> ssp. <i>neglecta</i>)	E	T; 1B.2	Valley and foothill grassland. Rocky serpentine sites.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.

Species	Federal	State	Habitat Association	Potential to Occur	
				Pier 31 ½	Fort Baker
Robust spineflower (<i>Chorizanthe robusta</i> var. <i>robusta</i>)	E	1B.1	Sandy or gravelly soils in maritime chaparral, openings in cismontane woodland, coastal dunes, and coastal scrub. Most populations extirpated, and now known from only six extended occurrences in Santa Cruz and Monterey Counties.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Presidio clarkia (<i>Clarkia franciscana</i>)	E	E; 1B.1	Coastal scrub and serpentinite soils in valley and foothill grassland.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Marin western-flax (<i>Hesperolinon congestum</i>)	T	T; 1B.1	Serpentinite soils in chaparral and valley and foothill grassland.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Santa Cruz tarplant (<i>Holocarpha macradenia</i>)	T	E; 1B.1	Coastal prairie, valley and foothill grassland. Light, sandy soil or sandy clay; often with non-natives.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Beach layia (<i>Layia canosa</i>)	E	E; 1B.1	Coastal dunes and sandy soils in coastal scrub.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
San Francisco lessingia (<i>Lessingia germanorum</i>)	E	E; 1B.1	Remnant dunes in coastal scrub. Populations known from only four occurrences in the Presidio.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
White-rayed pentachaeta (<i>Pentachaeta bellidiflora</i>)	E	E; 1B.1	Cismontane woodland and serpentine soils in valley and foothill grassland.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Tiburon jewelflower (<i>Streptanthus glandulosus</i> ssp. <i>niger</i>)	E	E; 1B.1	Valley and foothill grassland. Shallow, rocky serpentine slopes.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
California sea blite (<i>Suaeda californica</i>)	E	1B.1	Coastal salt marshes and swamps. Populations known only from Morrow Bay and near Cayucos Point; considered extirpated in the San Francisco Bay area.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Two-forkall clover (<i>Trifolium amoenum</i>)	E	1B.1	Coastal bluff scrub and valley and foothill grasslands (occasionally serpentinite soils).	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.

TABLE A-2
STATE LISTED THREATENED AND ENDANGERED PLANTS AND ADDITIONAL SPECIAL STATUS
WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE STUDY AREA
(FISH AND MARINE MAMMALS LISTED IN TABLE A-4)

Species	Federal	State	Habitat Association	Potential to Occur	
				Pier 31 ½	Fort Baker
Amphibians					
California giant salamander (<i>Dicamptodon ensatus</i>)		SSC	Aquatic, meadow and seep, north coast coniferous forest, riparian forest.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Foothill yellow-legged frog (<i>Rana boylei</i>)	-	SC	Partly-shaded, shallow streams and riffles with a rocky substrate in a variety of habitats. Need at least some cobble-sized substrate for egg-laying.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Reptiles					
Western pond turtle (<i>Emys marmorata</i>)	-	SSC	Freshwater ponds, marshes, and year-round streams.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Birds					
Short-eared owl (<i>Asio flammeus</i>)	-	SSC	Found in swamp lands, both fresh and salt; lowland meadows; irrigated alfalfa fields. Tule patches/tall grass needed for nesting/daytime seclusion. Nests on dry ground in depression concealed in vegetation.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Burrowing owl (<i>Athene cunicularia</i>)	-	SSC	Open, dry annual or perennial grasslands, deserts and scrublands characterized by low-growing vegetation. Subterranean nester, dependent upon burrowing mammals, most notably, the California ground squirrel.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Northern harrier (<i>Circus cyaneus</i>)	-	SSC	Coastal salt and fresh-water marsh. Nest and forage in grasslands, from salt grass in desert sink to mountain cienagas. Nests on ground in shrubby vegetation, usually at marsh edge; nest built of a large mound of sticks in wet areas.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Salt marsh common yellowthroat (<i>Geothlypis trichas sinuosa</i>)	-	SSC	Tidal salt marshes with adjacent riparian vegetation.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
California black rail (<i>Lateralus jamaicensis coturniculus</i>)	-	T; FP	Tidal salt marshes.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.

Species	Federal	State	Habitat Association	Potential to Occur	
				Pier 31 ½	Fort Baker
Alameda song sparrow (<i>Melospiza melodia pusillula</i>)	-	SSC	Tidal salt marshes.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
San Pablo song sparrow (<i>Melospiza melodia samuelis</i>)	-	SSC	Tidal salt marshes.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
California brown pelican (<i>Pelecanus occidentalis californicus</i>)	D	FP	Coastal waters along the Pacific Coast.	Potential to occur.	No potential to occur. Habitat not present.
Bank swallow (<i>Riparia riparia</i>)	-	T	Vertical banks or bluffs of friable soils suitable for burrowing.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Yellow-headed blackbird (<i>Xanthocephalus xanthocephalus</i>)	-	SSC	Marsh, swamp, and wetlands.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Mammals					
Pallid bat (<i>Antrozous pallidus</i>)	-	SSC	Deserts, grasslands, shrublands, woodlands, and forests. Most common in open, dry habitats with rocky areas for roosting. Roosts must protect bats from high temperatures. Very sensitive to disturbance of roosting sites.	No potential to occur. Habitat not present.	Low to moderate potential to occur. May roost in abandoned or minimally occupied structures within the study area.
Townsend's big-eared bat (<i>Corynorhinus (Plecotus) townsendii</i>)	-	SSC	Caves, mines, tunnels, buildings, or other human-made structures for roosting.	No potential to occur. Habitat not present	Low to moderate potential to occur. May roost in abandoned or minimally occupied structures within the study area.
Western red bat (<i>Lasiurus blossevillii</i>)	-	SSC	Woodland borders, rivers, agricultural areas, and urban areas with mature trees.	No potential to occur. Habitat not present	Low to moderate potential to occur. May roost in trees within the project area.
San Pablo vole (<i>Microtus californicus sanpabloensis</i>)	-	SSC	Saltmarshes of San Pablo Creek, on the south shore of San Pablo Bay. Constructs burrow in soft soil. Feeds on grasses, sedges, and herbs. Forms a network of runways leading from the burrow.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Big free-tailed bat (<i>Nyctinomops macrotis</i>)	-	SC	Low-lying arid areas in southern California. Need high cliffs or rocky outcrops for roosting sites. Feeds principally on large moths.	No potential to occur. Habitat not present.	Low to moderate potential to occur. May roost or forage in the project area.
Alameda Island mole	-	SSC	Valley and foothill grassland, only known in Alameda	No potential to occur.	No potential to occur.

Species	Federal	State	Habitat Association	Potential to Occur	
				Pier 31 ½	Fort Baker
<i>(Scapanus latimanus parvus)</i>			Island.	Habitat not present.	Habitat not present.
Salt-marsh wandering shrew <i>(Sorex vagrans halicoetes)</i>	-	SSC	Salt marshes of the south arm of San Francisco Bay. Medium high marsh 6 to 8 feet above sea level where abundant driftwood is scattered among imbricata.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
American badger <i>(Taxidea taxus)</i>	-	SSC	Open, arid habitats, commonly in grasslands, savannas, mountain meadows, and open areas of desert scrub.	No potential to occur. Habitat not present.	Low potential to occur. Known to occur in grasslands of Marin Headlands. May frequent coastal scrub at Fort Baker.
Point Reyes jumping mouse <i>(Zapus trinotatus orarius)</i>	-	SSC	Coastal forests; restricted to Point Reyes Peninsula.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Plants					
San Bruno Mountain manzanita <i>(Arctostaphylos imbricata)</i>	-	E; 1B.1	Rocky areas in chaparral and coastal scrub. Population known from fewer than five occurrences on San Bruno Mountain.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
Pacific manzanita <i>(Arctostaphylos pacifica)</i>	-	E; 1B.1	Chaparral, coastal scrub.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
San Francisco popcorn-flower <i>(Plagiobothrys diffusus)</i>	-	E; 1B.1	Coastal prairie and valley and foothill grassland. Populations in San Francisco are considered extirpated.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.
North Coast semaphore grass <i>(Pleuropogon hooverianus)</i>	-	T; 1B.1	Broadleafed upland forest, meadows and seeps, north coast coniferous forest. Wet grassy, usually shady areas, sometimes freshwater marsh; associated with forest environments.	No potential to occur. Habitat not present.	No potential to occur. Habitat not present.

D: Delisted

FP: fully protected

Rare Plant Rank 1B.1: rare, threatened, or endangered in California and elsewhere; seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)

SSC: state species of special concern

T: threatened

Additional Special-Status Plants. Plant species with a California Rare Plant Rank 1B (Plants Rare, Threatened or Endangered in California and Elsewhere), 2 (Plants Rare, Threatened or Endangered in California but More Common Elsewhere) or 3 (Plants About Which We Need More Information) are listed in Table A-3 below. Based on the current habitat conditions and the known range of these species, none of these have potential to occur within the study area:

TABLE A-3
ADDITIONAL CALIFORNIA NATIVE PLANT SPECIES LIST PLANT SPECIES WITH THE POTENTIAL TO OCCUR IN THE STUDY AREA

Common Name	Scientific Name	California Rare Plant Rank
Franciscan onion	<i>Allium peninsulare</i> var. <i>franciscanum</i>	1B.2

Santa Cruz microseris	<i>Stebbinsoseris decipiens</i>	1B.2

Common Name	Scientific Name	California Rare Plant Rank
Tamalpais jewelflower	<i>Streptanthus batrachopus</i>	1B.3
Mount Tamalpais bristly jewel-flower	<i>Streptanthus glandulosus</i> ssp. <i>pulchellus</i>	1B.2
Suisun Marsh aster	<i>Symphotrichum lentum</i>	1B.2
Saline clover	<i>Trifolium hydrophilum</i>	1B.2
San Francisco owl's-clover	<i>Triphysaria floribunda</i>	1B.2
Coastal triquetrella	<i>Triquetrella californica</i>	1B.2

Rare Plant Rank 1B.1 – rare, threatened, or endangered in California and elsewhere; seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)

Rare Plant Rank 1B.2 – rare, threatened, or endangered in California and elsewhere; fairly threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)

Rare Plant Rank 1B.3 – rare, threatened, or endangered in California and elsewhere; not very endangered in California

Rare Plant Rank 2B.2 - rare or Endangered in California, common elsewhere; fairly endangered in California

TABLE A-4
FEDERAL ESA- AND STATE ESA-LISTED MARINE SPECIES WITH THE POTENTIAL TO INHABIT THE STUDY AREA

Species	Federal	State	Habitat Association	Potential to Inhabit (Pier 31 ½ and Fort Baker)
Fish				
Green sturgeon southern DPS (<i>Acipenser medirostris</i>)	T	SSC	Marine and estuarine environments and Sacramento River; all of San Francisco Bay-Delta (Bay-Delta)	High potential to inhabit. Known to inhabit the Central Bay. Critical habitat present in the study area.
Tidewater goby (<i>Eucyclogobius newberryi</i>)	E	SSC	Brackish water habitats along the California coast from Agua Hedionda Lagoon, San Diego County to the mouth of the Smith River	No suitable habitat present. Species presumed to be extirpated from Bay-Delta.
Delta smelt (<i>Hypomesus transpacificus</i>)	T	E	Sacramento-San Joaquin Delta, Suisun Bay, San Pablo Bay, river channels and sloughs in Delta	Outside known range.
Central California coast ESU coho salmon (<i>Oncorhynchus kisutch</i>)	E	E	Ocean waters, Sacramento and San Joaquin Rivers; migrates from ocean through the Bay-Delta to freshwater spawning grounds	High potential to inhabit. Known to inhabit the Central Bay. Critical habitat present in the study area.
Central California coast DPS steelhead trout (<i>Oncorhynchus mykiss</i>)	T	SSC	Ocean waters, Sacramento and San Joaquin Rivers; migrates from ocean through the Bay-Delta to freshwater spawning grounds	High potential to inhabit. Known to inhabit the Central Bay. Critical habitat present in the study area.
Central Valley DPS steelhead trout (<i>Oncorhynchus mykiss</i>)	T	-	Ocean waters, Sacramento and San Joaquin Rivers; migrates from ocean through the Bay-Delta to freshwater spawning grounds	High potential to inhabit. Known to inhabit the Central Bay. Critical habitat present in the study area.
Sacramento River winter-run ESU Chinook salmon (<i>Oncorhynchus tshawytscha</i>)	E	E	Ocean waters, Sacramento and San Joaquin Rivers; migrates from ocean through the Bay-Delta to freshwater spawning grounds	High potential to inhabit. Known to inhabit the Central Bay. Critical habitat present in the study area.
Central Valley spring-run ESU Chinook salmon (<i>Oncorhynchus tshawytscha</i>)	T	T	Ocean waters, Sacramento and San Joaquin Rivers; migrates from ocean through the Bay-Delta to freshwater spawning grounds	High potential to inhabit. Known to inhabit the Central Bay. Critical habitat present in the study area.
Central Valley fall-run/late fall-run Chinook salmon (<i>Oncorhynchus tshawytscha</i>)	FSC	SSC	Ocean waters, Sacramento and San Joaquin Rivers; migrates from ocean through the Bay-Delta to freshwater spawning grounds	High potential to inhabit. Known to inhabit the Central Bay.
Longfin smelt (<i>Spirinchus thaleichthys</i>)	C	T; SSC	Euryhaline, nektonic, and anadromous. Found in open waters of estuaries, mostly in middle or bottom of water column.	High potential to inhabit. Known to inhabit Central Bay.

Species	Federal	State	Habitat Association	Potential to Inhabit (Pier 31 ½ and Fort Baker)
Eulachon (<i>Thaleichthys pacificus</i>)	T	-	Found in Klamath River, Mad River, Redwood Creek, and in small numbers in Smith River and Humboldt Bay tributaries.	No suitable habitat present. Outside of known range.
Marine Mammals				
Southern Sea Otter (<i>Enhydra lutris nereis</i>)	T	-	Nearshore marine environments from about Ano Nuevo, San Mateo Co. to Point Sal, Santa Barbara Co. Needs canopies of giant kelp and bull kelp for rafting and feeding. Prefers rocky substrates with abundant invertebrates.	No suitable habitat present. Outside of known range.
Humpback whale (<i>Megoptera noveangliae</i>)	E	SSC	Predominantly coastal waters, although occasional individuals enter the Bay-Delta.	Will not inhabit Project footprint. Infrequent transient visitor to the Bay, typically only in deeper waters.

C: candidate

DPS: distinct population segment

E: endangered

ESU: evolutionarily significant unit

FSC: federal species of special concern

SSC: state species of special concern

T: threatened

Appendix B
Supplemental Transportation Study
Fehr & Peers, February 2018

February 8, 2018

Ms. Julie Moore
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

**Subject: Alcatraz Embarkation Facility – Pier 31 ½ Transportation Circulation Study
Response to PMND Appeal Transportation Concerns**

Dear Julie:

We understand the Preliminary Mitigated Negative Declaration (PMND) on the above subject project has been appealed by the City of Sausalito. As noted in the PMND, the project would include ferry service from Pier 31 ½ to Fort Baker including up to two round trips on weekends only. The City of Sausalito's appeal, prepared by Sheppard Mullin, and dated December 27, 2017, claims that the Fort Baker ferry service component of the project may substantially increase visitor demand to Sausalito, exacerbating already-congested conditions along Sausalito's waterfront, which could potentially cause significant environmental impacts that were not evaluated in the PMND. Further, the City of Sausalito's appeal states that the PMND should have included more detailed discussion about the environmental setting further from Fort Baker, including the Marin Headlands, Alexander Avenue, and Sausalito.

This letter provides additional discussion of the environmental setting near Sausalito and additional discussion of travel demand specific to Sausalito that may be included in the PMND for informational purposes. This letter also includes a more specific response to the transportation-related concerns identified in the City of Sausalito's letter, based on the additional setting and travel demand analysis contained herein.

ADDITIONAL SETTING DISCUSSION

The PMND prepared for the Alcatraz Embarkation Facility did not forecast substantial amount of additional transportation demand between Fort Baker and Sausalito associated with the project. However, additional detail on the existing setting along Alexander Avenue and within Sausalito is provided here for informational purposes.

The City of Sausalito currently experiences high tourism on weekends, particularly during the summer months. On-street traffic and bicycle and pedestrian flows along the City's waterfront are

routine, including perceived high levels of congestion. The Golden Gate Bridge, Highway, and Transportation District (GGBHTD) and the Blue and Gold Fleet operate several ferries between Sausalito and San Francisco on weekends, with higher frequency during the peak summer periods. As part of a separate project, the GGBHTD plans to increase the size of the ferry terminal in Sausalito to accommodate increases in ferry ridership. According to the *Second Addendum to the 2012 Initial Study/Mitigated Negative Declaration and 2017 Addendum for the Sausalito Ferry Terminal* (LSA Associates, 2017) (Ferry Terminal Addendum), the number of ferry passengers with bicycles can reach up to 6,000 passengers per day on peak weekends, which contributes to the congestion in Sausalito and creates some operational challenges associated with loading/unloading passengers.

Specifically, the Ferry Terminal Addendum notes that the primary areas where congestion occurs are in the parking lot areas adjacent to the ferry terminal, with concentrations near the pier, the sidewalks connecting the pier to the local street network, and near the ferry ticket kiosk associated with ferry passengers with bicycles attempting to board ferries to return to San Francisco. The City of Sausalito has noted that this congestion creates safety concerns.

To manage the congestion, the City of Sausalito has adopted a number of strategies including physical improvements to better manage the demand and increased enforcement. The Ferry Terminal Addendum found that with active management to prevent queues from extending outside a designated queuing area, the proposed expansion project would have less than significant transportation impacts.

Fehr & Peers examined collision statistics for an approximately one quarter-mile long segment along Bridgeway, from Bay Street to a midblock location to the south, approximately at Scoma's restaurant for the most recent five-year period for which data is available, 2012-2016 (see Figure 1).¹ This area includes the area that experiences the highest levels of tourism-related congestion.

During that five-year period, a total of 17 collisions were reported. Three of the collisions were reported during weekends and five were reported on Fridays, with the remaining nine occurring on Mondays through Thursdays. Fourteen of the seventeen collisions involved bicycles or pedestrians (eight with bicycles and six with pedestrians). Five of the 17 collisions were reported during the

¹ California Statewide Integrated Traffic Records System (SWITRS), most recently accessed February 2, 2018. Note that records from 2015 and 2016 are considered provisional and subject to change.

month of June, with no other month experiencing more than two (January, September, and October each recorded two collisions). Overall, the data suggests that weekends do not appear to experience disproportionately high rates of collisions. However, the vast majority of reported collisions did involve bicycles or pedestrians. Detailed collision data are provided in the Appendix to this letter.

Figure 1 - Reported Collisions along Bridgeway in Sausalito (2012-2016)

In April 2017, Fehr & Peers completed a study for the Golden Gate National Recreation Area (GGNRA) of conditions at and around Vista Point at the Golden Gate Bridge, which included counts of traffic volumes and speeds along Alexander Avenue on summer weekends in 2016. Alexander Avenue, particularly north of Bunker Road, is the primary route to access Sausalito by car from San Francisco and points to the south, and thus, represents a reasonable proxy for tourist vehicle traffic to and from Sausalito. That study found that the peak traffic volume on Alexander Avenue, north of Bunker Road, near the Fort Baker site, was approximately 775 vehicles per hour on both Saturday and Sunday on a May weekend (May 14-15, 2016). During this same weekend, the 85th percentile

travel speed along the same portion of Alexander Avenue was approximately 40 mph. Traffic counts and speed survey data are included as an Appendix to this letter.

SUPPLEMENTAL ANALYSIS OF TRAVEL DEMAND TO SAUSALITO

As noted in Table 4 of the PMND, the Fort Baker ferry service component of the project would serve approximately 40,000 visitors annually, with service operating on weekends only via two round-trips per weekend day. Visitation is expected to vary by season, with summer and holiday weekends experiencing higher usage than the off-peak winter season. During typical off-peak days, the service is expected to serve approximately 250 visitors per weekend day. During peak weekends, visitor forecasts are expected to reach 500 passengers per day, or approximately 250 passengers per boat.

As noted in the Setting section, both the GGBHTD and the Blue and Gold Fleet operate several ferries between Sausalito and San Francisco on weekends, with higher frequency during the peak summer periods. Combined, the ferries operate approximately 12 round trips per day on peak summer weekends, with service between Sausalito and the San Francisco Ferry Terminal and Pier 41. Because the ferry service between Sausalito and San Francisco is so robust, it is unlikely that most visitors would choose to take a ferry to Fort Baker and then some other form of transportation to Sausalito, as it would be a more circuitous, time-consuming, and likely more expensive way to travel.² Instead the ferry service to Fort Baker would likely be most attractive to visitors who wish to visit Fort Baker's many uses, including the Cavallo Point Lodge (restaurant, spa, hotel, and conference center), the Bay Area Discovery Museum, Battery Yates and Battery Cavallo, the Travis Sailing Center/Presidio Yacht Club, or the California Coastal Trail in the Marin Headlands.

However, even if some users did elect to make the trip to Sausalito via Fort Baker, options for doing so are limited. Walking is not likely a viable option. The distance between Fort Baker and Sausalito is approximately 2 miles, and sidewalks or paths between the two are discontinuous. Pedestrians

² It is also unlikely that most visitors would take a ferry to downtown Sausalito from San Francisco and then travel to and from Fort Baker from downtown Sausalito because the distance between the San Francisco Ferry Building and Pier 31.5 is approximately one mile and the numerous travel options that exist between those two sites. In other words, it is most likely that if a visitor is destined for downtown Sausalito, they would leave from the San Francisco Ferry Building and if a visitor is destined for Fort Baker, they would leave from Pier 31.5.

would likely be forced to use Alexander Avenue or East Road, both of which are very narrow, windy, and steep with partial sidewalks, and would be extremely uncomfortable for pedestrians. Bicycling is also not a likely option, as bicycles would be prohibited on the Fort Baker ferries, and there are not currently any bicycle rental locations in Fort Baker, nor are there any known plans to add them. Thus passengers would not be able to obtain a bicycle in Fort Baker with which to ride to Sausalito. Finally, transit service between Fort Baker and Sausalito is virtually non-existent, and there are no shuttles currently or planned in the future. The most viable potential way for visitors to travel between Fort Baker and Sausalito would be by Transportation Network Company (TNC), such as Uber or Lyft, or other types of for-hire vehicles (e.g., taxis).

While traveling to Sausalito via Fort Baker does not appear to be a particularly convenient or desirable route, even if it were to occur, the number of new vehicles added to the roadway network would be small. For example, even if one-half of all ferry passengers were to travel to Sausalito (a conservatively large portion given the number of ferries that travel directly between San Francisco and Sausalito and the potential lack of TNC or other for-hire vehicle availability to arrive at one time given the lower relative density of demand for such for-hire vehicles compared to other places in the Bay Area (e.g., downtown San Francisco)), that would mean 125 passengers per ferry would travel to Sausalito. Based on the analysis in the PMND, average vehicle occupancy for visitors who arrived at the Pier 31 ½ Embarkation Facility in San Francisco was 3.9 persons per vehicle. It is reasonable to assume this represents an average group size, regardless of arrival mode in San Francisco. Assuming a vehicle occupancy of 3.9 passengers per vehicle means the 125 passengers per ferry would occupy 32 vehicles. Finally, if people were taking the ferry to Fort Baker and Sausalito, it is likely that some of those trips would have occurred anyway (or are currently occurring) by car, which means that the number of net new vehicle trips would be even lower than 32 for each ferry.

Thus, even under the very conservative assumption that 50 percent of Fort Baker ferry passengers eventually traveled to Sausalito, the number of net new car trips to Sausalito would likely be less than 30 vehicles per hour, even on a peak weekend. And, even if those trips happened to coincide with the peak hour of traffic volumes on Alexander Avenue, they would represent less than four percent of the existing peak weekend traffic on Alexander Avenue, north of Bunker Road.

While this relatively small (and hypothetical) increase in traffic due to TNCs traveling between Fort Baker and Sausalito would be very small in relation to the existing traffic along Alexander Road and in Sausalito, if that level of traffic were to appear at once within Fort Baker without any curbside management to facilitate safe unloading or loading of passengers, it may create some localized

congestion near the Fort Baker ferry landing. This would be a particular concern during the period when passengers disembark the ferry because they arrive simultaneously; passengers taking TNCs back to the ferry landing to return to San Francisco would likely arrive over a more dispersed period of time prior to the ferry departure, such that vehicles would not arrive simultaneously, drivers would drop off passengers, and queues would not form.

However, for the reasons described above, it is highly unlikely that passengers would disembark the ferry at Fort Baker and immediately request a TNC vehicle to transport them somewhere else that has existing ferry service, such as Sausalito. Instead, those who wish to visit Sausalito from Fort Baker would most likely chose to do so for a meal or sightseeing after completing whatever activities at Fort Baker they originally and primarily traveled for. In this instance, the instances of pick-up or drop-off would be dispersed over time during the day, and would not be concentrated at a specific location (i.e., the ferry landing); instead, they would be spread over multiple destinations within Fort Baker, and would not likely form queues or congestion at any particular point.

Thus, overall, as noted in the PMND, the project is not expected to add substantial increases in traffic, pedestrians or bicycling to Sausalito and therefore is not expected to exacerbate the existing pedestrian, bicycle, or traffic congestion levels described in the Setting section or to create new hazards or exacerbate any existing hazards. Additionally, the very small number of patrons that may travel to Sausalito by TNC vehicle, if any, would not likely create localized congestion near the ferry landing because pick-ups would be dispersed geographically and temporally.

RESPONSE TO TRANSPORTATION CONCERN

The City of Sausalito's appeal also cites the Fort Baker Plan EIS (p. 5-4), which states:

Increased visitation at Fort Baker would increase the demand for lodging, restaurant, and other tourist-oriented services in surrounding areas, especially in Sausalito, Tiburon, and San Francisco.

This statement was made in the context of the entire Fort Baker Plan, which included substantial improvements to the site's historic features and a new conference center, with new meeting space, up to 350 hotel rooms, spa, and restaurant components, an expansion to the Bay Area Discovery Museum, and parking for up to 455 vehicles. This general increase in activity at Fort Baker could reasonably be expected to generate demand for travel between the two sites, particularly for visitors with cars who would be staying at the Fort Baker conference facility for multiple days.

In contrast, the proposed Fort Baker ferry service would be for day trips for visitors from San Francisco who specifically wanted to visit Fort Baker, and not for visitors who were staying multiple days at Fort Baker for a conference who may wish to explore other parts of Marin County during their stay. While both the Fort Baker Plan and the Fort Baker ferry service could increase visitorship at Fort Baker, the types and travel patterns of visitors is different between conference attendees staying at Fort Baker and ferry passengers traveling there from San Francisco for the day. Thus, the conclusion that the Fort Baker ferry would not likely generate substantial increases in visitors to Sausalito is not inconsistent with the Fort Baker EIS.

The PMND included a detailed and adequate analysis of transportation conditions likely to be affected by the proposed project. As noted above, it is unlikely that a substantial amount of passengers would use the Fort Baker ferry to travel from San Francisco to Sausalito because there are so many direct ferries between the two cities, and the connections between Fort Baker and Sausalito are not particularly convenient. However, as noted above, even if some passengers did include a stop in Sausalito on their trip, the likely way to do so would be by TNC (e.g., Uber and Lyft) or other for-hire vehicle (e.g., taxi), and not by foot, bicycle, or transit. Even under a set of conservative assumptions, traffic volume increases would not likely be high enough to be perceptible to the public. Therefore, the project would not create new hazards or exacerbate existing hazards in and around Sausalito.

Further, as discussed on pp. 65-66 and p. 69 of the PRMD, the City of San Francisco does not use traffic congestion as a metric for assessing transportation impacts. Rather, consistent with Senate Bill 743 and recent supporting guidance from the State of California Governor's Office of Planning and Research (OPR), the City of San Francisco has adopted a VMT efficiency metric³. Thus, even if traffic from the Fort Baker ferry service were to increase congestion in Sausalito, it would not be considered a significant environmental impact.

The City of San Francisco does consider substantial conflicts between modes that create new or exacerbate existing safety problems to be a significant impact. However, as noted above, the vast majority of reported collisions in the last five years were mid-week, likely when congestion levels

³ San Francisco Planning Department, *Executive Summary: Resolution Modifying Transportation Impact Analysis*, March 3, 2016.

are lower and cars are traveling at faster speeds. The project would not be in operation mid-week, and would not likely increase bicycles or pedestrians in Sausalito on weekends, and therefore, would not exacerbate the City of Sausalito's safety concerns.

In summary, although congestion issues and conflicts between bicycles, pedestrians, and car traffic are perceived as high for the context of Sausalito, particularly during peak summer weekends, the project is not likely to contribute to that congestion or those conflicts in a meaningful way such that the project would create new significant impacts in Sausalito requiring mitigation.

We hope you have found this information helpful. Please do not hesitate to call if you have any questions.

Sincerely,
FEHR & PEERS

1. Mid-week average includes data between Tuesday and Thursday.

Collision Summary

This tool shows the summary of collision counts by collision factors, injury trends, and killed/injured victim.

- The summary was generated based on collision level result.
- The summary does not contain non-geocoded collisions. Please go to [SWITRS Query & Map](#) to look at the summary including non-geocoded collisions.
